Networking -- ICN 2005 Petre Dini,Pascal Lorenz,2005-03-31 The International Conference on Networking ICN 2005 was

the fourth conference in its series aimed at stimulating technical exchange in the emerging and important field of networking. On behalf of the International Advisory Committee it is our great pleasure to welcome you to the proceedings of the 2005 event. Networking faces dramatic changes due to the customer-centric view, the venue of the next generation networks paradigm, the push from ubiquitous networking and new service models. Despite legacy problems which researchers and industry are still discovering and improving, the state of the art the horizon has revealed new challenges that some of the authors tackled through their submissions. In fact ICN2005 was very well perceived by the international networking community. A total of 651 papers from more than 60 countries were submitted from which 238 were accepted. Each paper was reviewed by several members of the Technical Program Committee. This year the Advisory Committee revalidated various accepted papers after the reviews had been incorporated. We perceived a significant improvement in the number of submissions and the quality of the submissions. The ICN2005 program covered a variety of research topics that are of current interest, starting with Grid networks, multicasting, TCP optimizations, QoS and security, emergency services and network resiliency. The Program Committee selected also three tutorials and invited speakers that addressed the latest research results from the international industries and academia and reports on findings from mobile satellite and personal communications related to 3rd and 4th generation research projects and standardization.

Handbook of Constraint Programming Francesca Rossi, Peter van Beek, Toby Walsh, 2006-08-18

Constraint programming is a powerful paradigm for solving combinatorial search problems that draws on a wide range of techniques from artificial intelligence, computer science, databases, programming languages and operations research. Constraint programming is currently applied with success to many domains such as scheduling, planning, vehicle routing, configuration networks and bioinformatics. The aim of this handbook is to capture the full breadth and depth of the constraint programming field and to be encyclopedic in its scope and coverage. While there are several excellent books on constraint programming, such books necessarily focus on the main notions and techniques and cannot cover also extensions, applications and languages. The handbook gives a reasonably complete coverage of all these lines of work based on constraint programming so that a reader can have a rather precise idea of the whole field and its potential. Of course each line of work is dealt with in a survey-like style where some details may be neglected in favor of coverage. However the extensive bibliography of each chapter will help the interested readers to find suitable sources for the missing details. Each chapter of the handbook is intended to be a self-contained survey of a topic and is written by one or more authors who are leading researchers in the area. The intended audience of the handbook is researchers, graduate students, higher year undergraduates and practitioners who wish to learn about the state of the art in constraint programming. No prior knowledge about the field is necessary to be able to read the chapters and gather useful knowledge. Researchers from other fields should find in this handbook an effective way to learn about constraint programming and to possibly use some of the constraint programming concepts and techniques in their work, thus providing a means for a fruitful cross-fertilization among different research areas.

The handbook is organized in two parts The first part covers the basic foundations of constraint programming including the history the notion of constraint propagation basic search methods global constraints tractability and computational complexity and important issues in modeling a problem as a constraint problem The second part covers constraint languages and solver several useful extensions to the basic framework such as interval constraints structured domains and distributed CSPs and successful application areas for constraint programming Covers the whole field of constraint programming Survey style chapters Five chapters on applications

Domain-Specific Languages Walid Mohamed Taha,2009-07-06 Dijkstra once wrote that computer science is no more about computers than astronomy is about telescopes Despite the many incredible advances in computer science from times that predate practical mechanical computing there is still a myriad of fundamental questions in understanding the interface between computers and the rest of the world Why is it still hard to mechanize many tasks that seem to be fundamentally routine even as we see ever increasing capacity for raw mechanical computing The disciplined study of domain specific languages DSLs is an emerging area in computer science and is one which has the potential to revolutionize the field and bring us closer to answering this question DSLs are formalisms that have four general characteristics They relate to a well defined domain of discourse be it controlling traffic lights or space ships They have well defined notation such as the ones that exist for prescribing music dance routines or strategy in a football game The informal or intuitive meaning of the notation is clear This can easily be overlooked especially since intuitive meaning can be expressed by many different notations that may be received very differently by users The formal meaning is clear and mechanizable as is hopefully the case for the instructions we give to our bank or to a merchant online
