Ferreira, Robert Fellows, 2023-04-14 Sound, Music and Movement in Parkinson's Disease Marta M. N. Bieńkiewicz, Cathy Craig, 2017-01-05 Recent years have brought new insights to the understanding of Parkinson's disease impact of exercise and sound displays in rehabilitation and movement facilitation There is growing evidence that auditory signals in the environment can provide a temporal template for movement and change the mode of motor control from intrinsic to extrinsic habitual to goal directed enabling enhanced motor performance in patients In addition forced exercise rate studies show that exercising at the pace of healthy adults can have potential neuroprotective benefits for patients Many research groups have explored the use of auditory cues such as rhythmical auditory training in improving gait and upper limb movement parameters Cues are usually either intermittent metronome or continuous dynamic sound displays Similarly dance based interventions suggest that patients benefit from additional sensory information i e the temporal structure embedded in music and proprioceptive

information from a dancing partner that facilitates movement. On the contrary, studies dedicated to auditory perception and motor timing report an impaired ability of patients to perceive and synchronise with complex rhythmical structures, i.e. causing an inability to play musical instruments. With the growth of modern technology and the increasing portability of high specification devices such as smart phones, new research questions on the design of interventions are beginning to emerge as we strive for more efficient therapeutic approaches. In this Research Topic, we wanted to bring together top scientists from the movement disorder, motor control, and sound-related studies along with therapists. That way, we can engage in cross-disciplinary and challenging scientific debate about future rehabilitation avenues and frontiers for Parkinson's disease patients.
