Viacheslav V. Nikulin, Igor R. Shafarevich, 2012-12-06 This book is devoted to the theory of geometries which are locally Euclidean in the sense that in small regions they are identical to the geometry of the Euclidean plane or Euclidean 3 space Starting from the simplest examples we proceed to develop a general theory of such geometries based on their relation with discrete groups of motions of the Euclidean plane or 3 space we also consider the relation between discrete groups of motions and crystallography The description of locally Euclidean geometries of one type shows that these geometries are themselves naturally represented as the points of a new geometry The systematic study of this new geometry leads us to 2 dimensional Lobachevsky geometry also called non Euclidean or hyperbolic geometry which following the logic of our study is constructed starting from the properties of its group of motions Thus in this book we would like to introduce the reader to a theory of geometries which are different from the usual Euclidean geometry of the plane and 3 space in terms of examples which are accessible to a concrete and intuitive study The basic method of study is the use of groups of motions both discrete groups and the groups of motions of geometries The book does not presuppose on the part of the reader any preliminary knowledge outside the limits of a school geometry course **Mathematical Challenges For All** Roza Leikin, 2023-03-17
