

Physiology of Blood Worksheet

Student Name: _____

Time Estimate: 35 minutes

Background

Scientists can determine a person's blood type by adding various serums to the blood and seeing what makes clotting occur.

The serums they add to a blood sample are

- Anti-A (antibodies against antigen A)
- Anti-B (antibodies against antigen B)
- Anti-D (antibodies against Rhesus factor)

If the blood clots when one of these testing serums is added, it means the blood has the blood type matching the serum. For example, if anti-A is added to a blood sample and it clots, the blood sample is either blood type A or blood type AB.

Here is a chart of serum results for all the blood types. A solid well of red blood means no reaction and no clotting. A well with clumps of red indicates a reaction and clotting.

ABO Blood Grouping Interpretation
