

THE SKELETON
The skeleton is the framework of the body, supporting the soft organs and tissues. It is composed of bones and cartilage. The bones are made of a hard, white, mineralized substance called bone tissue. The cartilage is a soft, flexible tissue that connects the bones to each other and to the other parts of the body. The skeleton is divided into the axial skeleton (skull, spine, and rib cage) and the appendicular skeleton (arms and legs).

THE MUSCLES
The muscles are the soft tissue that contracts to move the bones. They are made of muscle fibers that are connected to each other by a network of nerves. The muscles are divided into the skeletal muscles (which are attached to the bones) and the smooth muscles (which are found in the walls of the internal organs).

THE JOINTS
The joints are the points where two or more bones meet. They allow the bones to move relative to each other. There are three main types of joints: the ball-and-socket joint (hip and shoulder), the hinge joint (elbow and knee), and the pivot joint (neck).

THE NERVOUS SYSTEM
The nervous system is the control system of the body. It is made of the brain, the spinal cord, and the nerves. The brain is the center of the nervous system, and it sends signals to the muscles and other parts of the body through the nerves. The spinal cord is a long, thin, tube-like structure that runs down the back, and it carries the signals from the brain to the rest of the body.

THE CIRCULATORY SYSTEM
The circulatory system is the system that transports blood throughout the body. It is made of the heart, the arteries, the veins, and the capillaries. The heart is the pump that moves the blood, and the arteries and veins are the pipes that carry the blood to and from the rest of the body. The capillaries are the small blood vessels that allow the blood to deliver oxygen and nutrients to the cells.

THE RESPIRATORY SYSTEM
The respiratory system is the system that allows the body to take in oxygen and breathe out carbon dioxide. It is made of the trachea (windpipe), the bronchi, and the lungs. The trachea is the tube that carries the air from the mouth to the lungs, and the bronchi are the branches of the trachea that lead to the lungs. The lungs are the organs that exchange oxygen and carbon dioxide with the blood.

THE DIGESTIVE SYSTEM
The digestive system is the system that breaks down the food into small pieces that can be absorbed by the body. It is made of the mouth, the esophagus, the stomach, the small intestine, and the large intestine. The mouth is where the food is taken in, and the esophagus is the tube that carries the food to the stomach. The stomach is where the food is broken down into small pieces, and the small intestine is where the nutrients are absorbed. The large intestine is where the waste is removed from the body.

THE EXCRETORY SYSTEM
The excretory system is the system that removes the waste from the body. It is made of the kidneys, the ureters, and the bladder. The kidneys are the organs that filter the blood and remove the waste, and the ureters are the tubes that carry the waste from the kidneys to the bladder. The bladder is the organ that stores the waste until it is removed from the body.

THE IMMUNE SYSTEM
The immune system is the system that protects the body from disease. It is made of the white blood cells, the antibodies, and the organs of the immune system. The white blood cells are the cells that fight the disease, and the antibodies are the proteins that help the white blood cells to recognize and destroy the disease-causing agents. The organs of the immune system are the thymus, the spleen, and the lymph nodes.
