

Combining Transformations

Section A

Complete the transformations by drawing the shapes on the coordinate grids.

- 1) Shape A is first reflected in the y -axis and then translated by the vector $\begin{pmatrix} 2 \\ 6 \end{pmatrix}$ to give Shape B.

- 3) Shape E is first enlarged by a scale factor of -2 from the center of enlargement $(2, -3)$ and secondly translated by the vector $\begin{pmatrix} -4 \\ 3 \end{pmatrix}$ to give Shape F.

- 5) Triangle I is enlarged by a scale factor of $\frac{1}{2}$, center of enlargement $(0, -1)$ and is then reflected in the line $y = -x$ to give Triangle J.

- 2) Triangle C is rotated 180° from the point $(-1, 2)$ and is then reflected in the line $y = x$ to give Triangle D.

- 4) Shape G is rotated 90° clockwise about the origin and is then reflected in the line $x = -3$ to give Shape H.

- 6) Shape K is first translated by the vector $\begin{pmatrix} 0 \\ -4 \end{pmatrix}$ and is secondly rotated by 90° counterclockwise about the point $(-1, 0)$ to give Shape L.

Micromechanics in Practice Michal Šejnoha, Jan Zeman, 2013 The book will concentrate on the application of micromechanics to the analysis of practical engineering problems Both classical composites represented by carbon carbon textile laminates and applications in Civil Engineering including asphalts and masonry structures will be considered A common denominator of these considerably distinct material systems will be randomness of their internal structure Also owing to their complexity all material systems will be studied on multiple scales Since real engineering rather than academic problems are of the main interest these scales will be treated independently from each other on the grounds of fully uncoupled multi scale analysis Attention will be limited to elastic and viscoelastic behaviour and to the linear heat transfer analysis To achieve this the book will address two different approaches to the homogenization of systems with random microstructures In particular classical averaging schemes based on the Eshelby solution of a solitary inclusion in an infinite medium represented by the Hashin Shtrikman variational principles or by considerably simpler and more popular Mori Tanaka method will be compared to detailed finite element simulations of a certain representative volume element RVE representing accommodated geometrical details of respective microstructures These are derived by matching material statistics such as the one and two point probability functions of real and artificial microstructures The latter one is termed the statistically equivalent periodic unit cell owing to the assumed periodic arrangement of reinforcements carbon fibres carbon fibre tows stones or masonry bricks in a certain matrix carbon matrix asphalt mastic mortar Other types of materials will be introduced in the form of exercises with emphases to the application of the Mori Tanaka method in the framework of the previously mentioned uncoupled multi scale analysis
