 4. species being classified
 5. clade
 6. node
 7. derived character
 8. a group of organisms that share a common ancestor
 9. Molecular systematics include derived characters are shared by which groups of organisms; the more derived characters a group of organisms has, the later it descended from the common ancestor
10. A node is a place where a branch splits. It represents the most common ancestor shared by a clade. (11. DPA: organisms/groups, nodes and relationships/branches, characters, etc.)
12. As more research is done and the evolutionary histories of different species become better understood, evolutionary trees are rearranged to reflect the most current scientific understanding.
 13. The species are very closely related; they share a relatively recent common ancestor.
 14. A phylogenetic tree is a diagram that shows the relationships between different groups of organisms.
 15. Cladistics is classification based on evolutionary relationships and a cladogram shows these relationships in a branching-tree diagram.
 16. Derived
 17. The morphology or the other distinct characteristics of an organism (organisms) are used to determine the relationship or genetic level.
 18. Classified species are more similar to each other through evolutionary relationships.
 19. These types of similarities are more likely the result of species sharing a common ancestor than are physical similarities.
 20. naming, classifying
 21. Name
 22. genus, species

SECTION 17.4 DOMAINS AND KINGDOMS

1. Since it reflects the most current understanding of how living things are related, new discoveries can change the way living things are classified.
2. Three hundred years ago, only two kingdoms were recognized. There is no kingdom system is more widely accepted.
3. The research revealed how genetically different groups of prokaryotes, which just had splitting kingdom. The new kingdom is Bacteria. The genetic and cellular differences were so great, that those from Kingdom were genetically almost entirely different.
