Advances in Visual Information Management Hiroshi Arisawa,Tiziana Catarci,2013-03-20 Video segmentation is the most fundamental process for appropriate indexing and retrieval of video intervals In general video streams are composed 1 of shots delimited by physical shot boundaries Substantial work has been done on how to detect such shot boundaries automatically Arman et al 1993 Zhang et al 1993 Zhang et al 1995 Kobla et al 1997 Through the integration of technologies such as image processing speech character recognition and natural language understanding keywords can be extracted and associated with these shots for indexing Wactlar et al 1996 A single shot however rarely carries enough amount of information to be meaningful by itself Usually it is a semantically meaningful interval that most users are interested in retrieving Generally such meaningful intervals span several consecutive shots There hardly exists any efficient and reliable technique either automatic or manual to identify all semantically meaningful intervals within a video stream Works by Smith and Davenport 1992 Oomoto and Tanaka 1993 Weiss et al 1995 Hjelmsvold et al 1996 suggest manually defining all such intervals in the database in advance However even an hour long video may have an indefinite number of meaningful intervals Moreover video data is multi interpretative Therefore given a query what is a meaningful interval to an annotator may not be meaningful to the user who issues the query In practice manual indexing of meaningful intervals is labour intensive and inadequate
