

AQA Chemistry triple Paper 1 2023

Why is it called the periodic table? - ANS-because the word "periodic" means similar properties occurring at regular intervals and they are grouped by their similar properties

How many columns are in the periodic table? - ANS-18 columns that are grouped into 1,2,3,4,5,6,7,0 and transition metals in the middle

How are elements arranged on the periodic table? - ANS-In order of increasing atomic number. Left to the "stairs" contain metals, right to the "stairs" contain nonmetals.

What is Döbreiners Triads? - ANS-- scientist who noticed elements had similar chemical properties, they occurred in threes.

- these groups were called "triads" , an example would be Lithium, Sodium and Potassium which all react rapidly with water

What are Newlands' Octaves? - ANS-- 40 years after Döbreiner , Newland noticed that after he arranged elements in increasing atomic weight , every 8th element had similar properties (eg. Lithium, sodium and potassium)

-called law of octaves

-problems with this, by always sticking to exact order of weight some elements were grouped together that had totally different properties

Who developed the first periodic table? - ANS--Dmitri Mendeleev in 1869

-started arranging elements in order of atomic mass

- would switch order of specific elements so they fit patterns of others in the group

- left gaps for undiscovered elements

-predicted properties of undiscovered ones so scientists accepted his one as correct

Differences between the first periodic table and the modern periodic table - ANS--

arranged in order of atomic number (number of protons) this is because they weren't discovered at his time so he ordered them in order of atomic weight

- atomic weight method is faulty as elements can appear in wrong order due to isotopes

- modern periodic table has group 0 , noble gases

Aqa Chemistry Monday 20th May Answers

CGP. Books

Aqa Chemistry Monday 20th May Answers:

The Chemical Engineer ,1994 Listener and BBC Television Review ,1986 New Scientist ,2001
