Islam and Christianity Contrasted Ed Ward,2021 My first exposure to Muslims was in 2005 in Morocco I enjoyed my visit and was surprised by the Berbers hospitality I was fascinated by the eagerness of Muslims to discuss God While sharing personal stories was important our conversations always concluded with talking about God Discussions about our faiths was the foremost topic of my conversations with Muslims Over the years I have compared the teachings of Islam with the Christian Scriptures I have found the narratives differing in detail and concepts conflicting in perspective These theological differences confirm that Islam and Christianity do not worship the same God For example the Quran teaches that Allah commanded angels to bow down to Adam at creation Satan refused and Allah banished him to the earth Qu 7 11 13 According to the Bible Yhwh would never command angels to bow down to man for only Yhwh is worthy of worship For an angel to bow down to man is idolatry I have observed many debates between Muslims and Christians Muslim debaters seldom stay on the agreed topic Instead they divert from the subject to ridicule and debase Christianity as foolishness I have found that while Muslims ask difficult questions of Christianity they never ask the same questions of Islam Islam and Christianity Contrasted will seek answers to those questions from the early Islamic sources and compare them with the teachings of the Bible The Quran early hadiths Islamic history and four established translations of the Bible will be consulted I hope that through Islam and Christianity Contrasted both Muslims and Christians will have a deeper understanding of one another s faith

Geometry Transformed: Euclidean Plane Geometry Based on Rigid Motions James R. King, 2021-04-26 Many paths lead into Euclidean plane geometry Geometry Transformed offers an expeditious yet rigorous route using axioms based on rigid motions and dilations Since transformations are available at the outset interesting theorems can be proved sooner and proofs can be connected to visual and tactile intuition about symmetry and motion The reader thus gains valuable experience thinking with transformations a skill that may be useful in other math courses or applications For students interested in teaching mathematics at the secondary school level this approach is particularly useful since geometry in the Common Core State Standards is based on rigid motions The only prerequisite for this book is a basic understanding of functions Some previous experience with proofs may be helpful but students can also learn about proofs by experiencing them in this book in a context where they can draw and experiment The eleven chapters are organized in a flexible way to suit a variety of curriculum goals In addition to a geometrical core that includes finite symmetry groups there are additional topics on circles and on crystallographic and frieze groups and a final chapter on affine and Cartesian coordinates The exercises are a mixture of routine problems experiments and proofs
