AQA Biology, 2005, Unit 5 (Question 4)

- 2 Brown rats are classed as pests. Warfarin has been used as a rodenticide since the 1950s. Warfarin interferes with the way in which vitamin K is used in blood clotting. Rats which eat warfarin are killed due to internal bleeding.

Warfarin-resistant rats have been identified in various parts of Britain. Resistance to warfarin is determined by a gene with two codominant alleles, W^R and W^S .

Some rats are resistant to warfarin as they have the allele W^R . Rats have three possible genotypes:

1. $W^R W^R$ resistant to warfarin but with a very high requirement for vitamin K
2. $W^R W^S$ resistant to warfarin with slightly increased vitamin K requirement
3. $W^S W^S$ susceptible (not resistant) to warfarin with normal low requirement for vitamin K.

In addition, rats with the genotype $W^R W^R$ require very large amounts of vitamin K in their diets. If they do not receive this they will die within a few days due to internal bleeding.
