Principles of Data Mining David J. Hand, Heikki Mannila, Padhraic Smyth, 2001-08-17 The first truly interdisciplinary text on data mining blending the contributions of information science computer science and statistics The growing interest in data mining is motivated by a common problem across disciplines how does one store access model and ultimately describe and understand very large data sets Historically different aspects of data mining have been addressed independently by different disciplines This is the first truly interdisciplinary text on data mining blending the contributions of information science computer science and statistics The book consists of three sections The first foundations provides a tutorial overview of the principles underlying data mining algorithms and their application The presentation emphasizes intuition rather than

rigor The second section data mining algorithms shows how algorithms are constructed to solve specific problems in a principled manner The algorithms covered include trees and rules for classification and regression association rules belief networks classical statistical models nonlinear models such as neural networks and local memory based models The third section shows how all of the preceding analysis fits together when applied to real world data mining problems Topics include the role of metadata how to handle missing data and data preprocessing

Data Mining Algorithms Pawel Cichosz, 2014-11-10 Data Mining Algorithms is a practical technically oriented guide to data mining algorithms that covers the most important algorithms for building classification regression and clustering models as well as techniques used for attribute selection and transformation model quality evaluation and creating model ensembles The author presents many of the important topics and methodologies widely used in data mining whilst demonstrating the internal operation and usage of data mining algorithms using examples in R

Automating the Design of Data Mining Algorithms Gisele L. Pappa, Alex Freitas, 2009-10-27 Data mining is a very active research area with many successful real world applications It consists of a set of concepts and methods used to extract interesting or useful knowledge or patterns from real world datasets providing valuable support for decision making in industry business government and science Although there are already many types of data mining algorithms available in the literature it is still difficult for users to choose the best possible data mining algorithm for their particular data mining problem In addition data mining algorithms have been manually designed therefore they incorporate human biases and preferences This book proposes a new approach to the design of data mining algorithms instead of relying on the slow and ad hoc process of manual algorithm design this book proposes systematically automating the design of data mining algorithms with an evolutionary computation approach More precisely we propose a genetic programming system a type of evolutionary computation method that evolves computer programs to automate the design of rule induction algorithms a type of classification method that discovers a set of classification rules from data We focus on genetic programming in this book because it is the paradigmatic type of machine learning method for automating the generation of programs and because it has the advantage of performing a global search in the space of candidate solutions data mining algorithms in our case but in principle other types of search methods for this task could be investigated in the future

Metalearning Pavel Brazdil, Christophe Giraud Carrier, Carlos Soares, Ricardo Vilalta, 2008-11-18 Metalearning is the study of principled methods that exploit metaknowledge to obtain efficient models and solutions by adapting machine learning and data mining processes While the variety of machine learning and data mining techniques now available can in principle provide good model solutions a methodology is still needed to guide the search for the most appropriate model in an efficient way Metalearning provides one such methodology that allows systems to become more effective through experience This book discusses several approaches to obtaining knowledge concerning the performance of machine learning and data mining algorithms It shows how this knowledge can be reused to select combine compose and adapt both algorithms and

models to yield faster more effective solutions to data mining problems It can thus help developers improve their algorithms and also develop learning systems that can improve themselves The book will be of interest to researchers and graduate students in the areas of machine learning data mining and artificial intelligence Data Preprocessing in Data Mining Salvador García,Julián Luengo,Francisco Herrera,2014-08-30 Data Preprocessing for Data Mining addresses one of the most important issues within the well known Knowledge Discovery from Data process Data directly taken from the source will likely have inconsistencies errors or most importantly it is not ready to be considered for a data mining process Furthermore the increasing amount of data in recent science industry and business applications calls to the requirement of more complex tools to analyze it Thanks to data preprocessing it is possible to convert the impossible into possible adapting the data to fulfill the input demands of each data mining algorithm Data preprocessing includes the data reduction techniques which aim at reducing the complexity of the data detecting or removing irrelevant and noisy elements from the data This book is intended to review the tasks that fill the gap between the data acquisition from the source and the data mining process A comprehensive look from a practical point of view including basic concepts and surveying the techniques proposed in the specialized literature is given Each chapter is a stand alone guide to a particular data preprocessing topic from basic concepts and detailed descriptions of classical algorithms to an incursion of an exhaustive catalog of recent developments The in depth technical descriptions make this book suitable for technical professionals researchers senior undergraduate and graduate students in data science computer science and engineering Data Mining and Knowledge Discovery with Evolutionary Algorithms Alex A. Freitas,2002-08-21 This book integrates two areas of computer science namely data mining and evolutionary algorithms Both these areas have become increasingly popular in the last few years and their integration is currently an active research area In general data mining consists of extracting knowledge from data The motivation for applying evolutionary algorithms to data mining is that evolutionary algorithms are robust search methods which perform a global search in the space of candidate solutions This book emphasizes the importance of discovering comprehensible interesting knowledge which is potentially useful for intelligent decision making The text explains both basic concepts and advanced topics Recent Advances in Data Mining of Enterprise Data T. Warren Liao,Evangelos Triantaphyllou,2008-01-15 The main goal of the new field of data mining is the analysis of large and complex datasets Some very important datasets may be derived from business and industrial activities This kind of data is known as OC enterprise dataOCO The common characteristic of such datasets is that the analyst wishes to analyze them for the purpose of designing a more cost effective strategy for optimizing some type of performance measure such as reducing production time improving quality eliminating wastes or maximizing profit Data in this category may describe different scheduling scenarios in a manufacturing environment quality control of some process fault diagnosis in the operation of a machine or process risk analysis when issuing credit to applicants management of supply chains in a manufacturing system or data for business related decision
