Cooperative Research Projects ,1960 The Joy of Factoring Samuel S. Wagstaff (Jr.),2013-10-24 This book is about the theory and practice of integer factorization presented in a historic perspective It describes about twenty algorithms for factoring and a dozen other number theory algorithms that support the factoring algorithms Most algorithms are described both in words and in pseudocode to satisfy both number theorists and computer scientists Each of the ten chapters begins with a concise summary of its contents This book is written for readers who want to learn more about the best methods of factoring integers many reasons for factoring and some history of this fascinating subject It can be read by anyone who has taken a first course in number theory Publisher website The Mathematics Education for the Future Project - Proceedings of the 14th International Conference Alan Rogerson,Janina Morska,2017-07-01 This volume contains the papers presented at the International Conference on Challenges in Mathematics Education for the Next Decade held from September 10 15 2017 in Balatonf red Hungary The Conference was organized by The Mathematics Education for the Future Project an international edu cational project founded in 1986 Project and Cost Engineers' Handbook Kenneth K.

Humphreys,2004-11-30 Making the specifics of a complex concern accessible and its handling quite manageable this fourth edition of the Project and Cost Engineers Handbook examines the variables associated with international projects and project risk analysis It provides instruction on contingency planning delves into ethical considerations considers the imp *Course and Curriculum Improvement Projects: Mathematics, Science, Social Sciences* National Science Foundation (U.S.),1966

Guerrero, *A Course in Computational Algebraic Number Theory* Henri Cohen,2013-04-17 With the advent of powerful computing tools and numerous advances in mathematics computer science and cryptography algorithmic number theory has become an important subject in its own right Both external and internal pressures gave a powerful impetus to the development of more powerful algorithms These in turn led to a large number of spectacular breakthroughs To mention but a few the LLL algorithm which has a wide range of applications including real world applications to integer programming primality testing and factoring algorithms sub exponential class group and regulator algorithms etc Several books exist which treat parts of this subject It is essentially impossible for an author to keep up with the rapid pace of progress in all areas of this subject Each book emphasizes a different area corresponding to the author's tastes and interests The most famous but unfortunately the oldest is Knuth's *Art of Computer Programming* especially Chapter 4 The present book has two goals First to give a reasonably comprehensive introductory course in computational number theory In particular although we study some subjects in great detail others are only mentioned but with suitable pointers to the literature Hence we hope that this book can serve as a first course on the subject A natural sequel would be to study more specialized subjects in the existing literature Project Report USAF School of Aerospace Medicine,1959 **Research in Education** ,1974 **Project and Cost Engineers' Handbook, Third Edition**, Kenneth King Humphreys,Lloyd M. English,1992-11-19 Designed as a day to day resource for practitioners and a self study guide for the AACE International Cost Engineers certification examination This third edition has been revised and expanded and topics covered include project evaluation project management and planning and scheduling **Computation and Comparison of Efficient Turbulence Models for Aeronautics — European Research Project ETMA** Alain Dervieux,Marianna Braza,Jean-Paul Dussauge,2013-04-17 The computation of complex turbulent flows by statistical modelling has already a long history The most popular two equation models today were introduced in the early seventies However these models have been generally tested in rather academic cases The development of computers has led to more and more accurate numerical methods The interactions between numerical and modelling techniques are generally not well mastered Moreover computation of real life cases including 3D effects complex geometries and pressure gradients based on two equation models with low Reynolds treatment at the proximity of walls are not really of common use A large number of models has been proposed this is perhaps the sign that none of them is really satisfactory and then the assessment of their generality is not an easy task it requires a lot of understanding of the physics and a lot of work for testing the large number of relevant cases in order to assess their limits of validity which is a condition for an improved confidence in engineering applications This is probably why workshops and working groups are frequent and the ETMA consortium has chosen to build a state of the art in theoretical and numerical statistical turbulence modelling for real life
