

5. Two blocks A and B are resting against the wall and floor as shown in figure. Find minimum value of P that will hold the system in equilibrium. $\mu = 0.25$ at the floor, $\mu = 0.3$ at the wall and $\mu = 0.2$ between the blocks.

PROBLEMS ON LADDERS

We have all made use of ladders at one time or the other to reach for things kept high. But every time while climbing the ladder we fear that the ladder might slip. All this is because the friction force at the floor and at the wall is responsible for preventing the slip. If these surfaces do not produce sufficient frictional force the ladder would slip. Invariably we adjust the slope of the ladder and even ask someone to hold the ladder as we use it. The mechanics involving ladders is dealt in this section.

Forces acting on ladder viz. the normal reactions and friction-force at the floor and wall contact points, the weight of the ladder, the weight of the person climbing the ladder and any other force, form a non-concurrent force system. It will therefore require all the three COE viz. $\sum F_x = 0$, $\sum F_y = 0$ and $\sum M = 0$ for analyzing the equilibrium of a ladder.

EXERCISE 3

1. A person of weight $P = 600$ N ascends the 5 m ladder of weight 400 N as shown. How far up the ladder may the person climb before sliding motion of ladder takes place.
2. A 100 N uniform ladder AB is held in equilibrium as shown. If $\mu = 0.15$ at A and B, calculate the range of values of P for which equilibrium is maintained.
