— The diagonal of a rectangle creates a right triangle.

— Always check special right triangle multiples, and identify the Hypotenuse: 3, 4, 5 → 6, 8, 10

Seismic Design and Analysis of Tanks Gian Michele Calvi, Roberto Nascimbene, 2023-03-21

Seismic Design and Analysis of Tanks A detailed view on the effects of seismic activity on tank structures As the use of above ground and underground storage tanks ASTs and USTs continues to grow with approximately 545 000 in the USA alone the greatest threat to ASTs and USTs is earthquakes causing the contamination of groundwater a vital source of drinking water throughout the world These tanks suffer a great deal of strain during an earthquake as a complicated pattern of stress affects them such that poorly designed tanks have leaked buckled or even collapsed during seismic events Furthermore in oil and gas industrial plants the risk of damage is even more critical due to the effects of explosion collapse and air or soil contamination by chemical fluid spillages

Seismic Design and Analysis of Tanks provides the first in depth discussion of the principles and applications of shell structure design and earthquake engineering analyses focused on tank structures and it explains how these methodologies can help prevent the destruction of ASTs and USTs during earthquakes Providing a thorough examination of the design analysis and performance of steel reinforced concrete and precast tanks this book takes a look at tanks that are above ground underground or elevated anchored and unanchored and rigid or flexible and evaluates the efficacy of each method during times of seismic shaking and it does so without getting bogged down in impenetrable mathematics and theory

Seismic Design and Analysis of Tanks readers will also find A global approach to the best analytical and practical solutions available in each region discussion of the latest US codes and standards from the American Society of Civil Engineers ACSE 7 the American Concrete Institute ACI 350 3 371 R the American Water Works Association AWWA D100 D110 D115 and the American Petroleum Institute API 650 an overview of the European codes and standards including Eurocode 8 4 and CEN EN 14015 Hundreds of step by step equations accompanied by illustrations Photographs illustrating real world damage to tanks caused by seismic events Perfect for practising structural engineers geotechnical engineers civil engineers and engineers of all kinds who are responsible for the design analysis and performance of tanks and their foundations as well as students studying engineering

Seismic Design and Analysis of Tanks is a landmark text the first work of its kind to deal with the seismic engineering performance of all types of storage tanks

Convex Optimization & Euclidean Distance Geometry Jon Dattorro, 2005 The study of Euclidean distance matrices EDMs fundamentally asks what can be known geometrically given only distance information between points in Euclidean space Each point may represent simply location or abstractly any entity expressible

as a vector in finite dimensional Euclidean space The answer to the question posed is that very much can be known about the points the mathematics of this combined study of geometry and optimization is rich and deep Throughout we cite beacons of historical accomplishment The application of EDMs has already proven invaluable in discerning biological molecular conformation The emerging practice of localization in wireless sensor networks the global positioning system GPS and distance based pattern recognition will certainly simplify and benefit from this theory We study the pervasive convex Euclidean bodies and their various representations In particular we make convex polyhedra cones and dual cones more visceral through illustration and we study the geometric relation of polyhedral cones to nonorthogonal bases biorthogonal expansion We explain conversion between halfspace and vertex descriptions of convex cones we provide formulae for determining dual cones and we show how classic alternative systems of linear inequalities or linear matrix inequalities and optimality conditions can be explained by generalized inequalities in terms of convex cones and their duals The conic analogue to linear independence called conic independence is introduced as a new tool in the study of classical cone theory the logical next step in the progression linear affine conic Any convex optimization problem has geometric interpretation This is a powerful attraction the ability to visualize geometry of an optimization problem We provide tools to make visualization easier The concept of faces extreme points and extreme directions of convex Euclidean bodies is explained here crucial to understanding convex optimization The convex cone of positive semidefinite matrices in particular is studied in depth We mathematically interpret for example its inverse image under affine transformation and we explain how higher rank subsets of its boundary united with its interior are convex The Chapter on Geometry of convex functions observes analogies between convex sets and functions The set of all vector valued convex functions is a closed convex cone Included among the examples in this chapter we show how the real affine function relates to convex functions as the hyperplane relates to convex sets Here also pertinent results for multidimensional convex functions are presented that are largely ignored in the literature tricks and tips for determining their convexity and discerning their geometry particularly with regard to matrix calculus which remains largely unsystematized when compared with the traditional practice of ordinary calculus Consequently we collect some results of matrix differentiation in the appendices The Euclidean distance matrix EDM is studied its properties and relationship to both positive semidefinite and Gram matrices We relate the EDM to the four classical axioms of the Euclidean metric thereby observing the existence of an infinity of axioms of the Euclidean metric beyond the triangle inequality We proceed by deriving the fifth Euclidean axiom and then explain why furthering this endeavor is inefficient because the ensuing criteria while describing polyhedra grow linearly in complexity and number Some geometrical problems solvable via EDMs EDM problems posed as convex optimization and methods of solution are presented eg we generate a recognizable isotonic map of the United States using only comparative distance information no distance information only distance inequalities We offer a new proof of the classic Schoenberg criterion that determines whether a candidate matrix is an EDM Our proof relies

on fundamental geometry assuming any EDM must correspond to a list of points contained in some polyhedron possibly at its vertices and vice versa It is not widely known that the Schoenberg criterion implies nonnegativity of the EDM entries proved here We characterize the eigenvalues of an EDM matrix and then devise a polyhedral cone required for determining membership of a candidate matrix in Cayley Menger form to the convex cone of Euclidean distance matrices EDM cone ie a candidate is an EDM if and only if its eigenspectrum belongs to a spectral cone for EDM N We will see spectral cones are not unique In the chapter EDM cone we explain the geometric relationship between the EDM cone two positive semidefinite cones and the ellipsope We illustrate geometric requirements in particular for projection of a candidate matrix on a positive semidefinite cone that establish its membership to the EDM cone The faces of the EDM cone are described but still open is the question whether all its faces are exposed as they are for the positive semidefinite cone The classic Schoenberg criterion relating EDM and positive semidefinite cones is revealed to be a discretized membership relation a generalized inequality a new Farkas like lemma between the EDM cone and its ordinary dual A matrix criterion for membership to the dual EDM cone is derived that is simpler than the Schoenberg criterion We derive a new concise expression for the EDM cone and its dual involving two subspaces and a positive semidefinite cone Semidefinite programming is reviewed with particular attention to optimality conditions of prototypical primal and dual conic programs their interplay and the perturbation method of rank reduction of optimal solutions extant but not well known We show how to solve a ubiquitous platonic combinatorial optimization problem from linear algebra the optimal Boolean solution x to $Ax \leq b$ via semidefinite program relaxation A three dimensional polyhedral analogue for the positive semidefinite cone of 3×3 symmetric matrices is introduced a tool for visualizing in 6 dimensions In EDM proximity we explore methods of solution to a few fundamental and prevalent Euclidean distance matrix proximity problems the problem of finding that Euclidean distance matrix closest to a given matrix in the Euclidean sense We pay particular attention to the problem when compounded with rank minimization We offer a new geometrical proof of a famous result discovered by Eckart Young in 1936 regarding Euclidean projection of a point on a subset of the positive semidefinite cone comprising all positive semidefinite matrices having rank not exceeding a prescribed limit ρ We explain how this problem is transformed to a convex optimization for any rank ρ
