Cytochromes P450: Drug Metabolism, Bioactivation and Biodiversity 2.0 Patrick M. Dansette, Danièle Werck-Reichhart, 2021-08-31 This book Cytochromes P450 Drug Metabolism Bioactivation and Biodiversity presents five papers on human cytochrome P450 CYP and P450 reductase three reviews on the role of CYPs in humans and their use as biomarkers six papers on CYPs in microorganisms and one study on CYP in insects The first paper reports the in silico modeling of human CYP3A4 access channels The second uses structural methods to explain the mechanism based inactivation of CYP3A4 by mibefradil 6 7 dihydroxy bergamottin and azamulin The third article compares electron transfer in CYP2C9 and CYP2C19 using structural and biochemical methods and the fourth uses kinetic methods to study electron transfer to CYP2C8 allelic mutants The fifth article characterizes electron transfer between the reductase and CYP using in silico and in vitro methods focusing on the conformations of the reductase Then two reviews describe clinical implications in cardiology and oncology and the role of fatty acid metabolism in cardiology and skin diseases The second review is on the potential use of circulating extracellular vesicles as biomarkers Five papers analyze the CYPomes of diverse microorganisms the Bacillus genus Mycobacteria the fungi Tremellomycetes Cyanobacteria and Streptomyces The sixth focuses on a specific Mycobacterium CYP CYP128 and its importance in M tuberculosis The subject of the last paper is CYP in Sogatella furcifera a plant pest and its resistance to the insecticide sulfoxaflor Application of Selected Reaction Monitoring to Highly Multiplexed Targeted Quantitative Proteomics Michael Kinter, Caroline S. Kinter, 2013-09-17 A key experiment in biomedical research is monitoring the expression of different proteins in order to detect changes that occur in biological systems under different experimental conditions The method that is most widely used is the Western blot analysis While Western blot is a workhorse in laboratories studying protein expression and has several advantages it also has a number of significant limitations In particular the method is semi quantitative with limited dynamic range Western blot focuses on a single protein per sample with only a small number of representative samples analyzed in an experiment New quantitative tools have been needed for some time to at least supplement possibly replace the Western blot Mass spectrometric methods have begun to compete with Western blot for routine quantitative analyses of proteins One of these methods is based on the tandem mass spectrometry technique of selected reaction monitoring SRM which is also called multiple reaction monitoring MRM Selected reaction monitoring is actually an older tandem mass spectrometry technique first described in the late 70s that is widely utilized in the quantitative analysis of small molecules like drugs metabolites The use of selected reaction monitoring for the

quantitative analysis of proteins has a number of advantages Most importantly it is fundamentally quantitative with a wide dynamic range The output of the analysis is a numerical result that can range over several orders of magnitude Other advantages include sufficient specificity sensitivity to detect low abundance proteins in complex mixtures Finally selected reaction monitoring can be multiplexed to allow the quantitative analysis of relatively large numbers of proteins in a single sample in a single experiment This Brief will explain both the theoretical experimental details of the selected reaction monitoring experiment as it is applied to proteins

Soybean Breeding for Abiotic Stress Tolerance: Towards Sustainable Agriculture Huatao Chen,Donghe Xu, Henry T. Nguyen, Li Song, Chengfu Su, 2025-05-07 Soybeans hold immense global importance as one of the most significant crops worldwide due to their numerous applications and high demand They are cultivated in countries such as the United States Brazil Argentina and China among others Soybeans can be grown as cash crops or as part of crop rotation systems aiding in soil fertility improvement

- 1 Food and Feed Soybeans are a major source of plant based protein making them an essential component in the global food supply chain They undergo processing to produce a wide range of food products including tofu soy milk meat substitutes and cooking oils Additionally soybean meal a byproduct of oil extraction serves as animal feed for livestock poultry and aquaculture industries
- 2 High Yield and Versatility Soybeans exhibit relatively high yields per acre compared to many other crops This characteristic coupled with their adaptability to various climates and soil types positions them as an economically valuable and versatile crop for farmers
- 3 Biodiesel Production Soybean oil can serve as a feedstock for biodiesel production offering a renewable and environmentally friendly alternative to fossil fuels The demand for biodiesel has risen in recent years due to concerns about climate change and the need for sustainable energy sources
- 4 Crop Rotation and Soil Health Soybeans are commonly integrated into crop rotation systems to enhance soil fertility and reduce pest and disease pressure They have the capacity to fix nitrogen from the atmosphere which enhances soil nitrogen levels and diminishes the requirement for synthetic fertilizers in subsequent crops
