

FOUR STROKE ENGINE

© 2008 ENGINELEARNER.COM

The four stroke engine is the most common type of internal combustion engine. It is used in a wide range of applications from small portable generators to large marine engines. The four stroke cycle consists of four distinct strokes: intake, compression, combustion, and exhaust. Each stroke is performed by one of the two valves (intake and exhaust) and the piston. The intake stroke draws the mixture into the cylinder, the compression stroke compresses the mixture, the combustion stroke ignites the mixture, and the exhaust stroke expels the exhaust gases.

During the compression stroke, the mixture is compressed into a smaller volume, increasing its temperature and pressure. This prepares the mixture for ignition during the combustion stroke.

The exhaust stroke is the final stroke of the four stroke cycle. The exhaust valve is open, allowing the exhaust gases to exit the cylinder. The piston is moving up, pushing the exhaust gases out of the cylinder.
