Astrostatistics Gutti Jogesh Babu, E.D. Feigelson, 1996-08-01 Modern astronomers encounter a vast range of challenging statistical problems yet few are familiar with the wealth of techniques developed by statisticians Conversely few statisticians deal with the compelling problems confronted in astronomy *Astrostatistics* bridges this gap Authored by a statistician astronomer team it provides professionals and advanced students in both fields with exposure to issues of mutual interest In the first half of the book the authors introduce statisticians to stellar galactic and cosmological astronomy and discuss the complex character of astronomical data For astronomers they introduce the statistical principles of nonparametrics multivariate analysis time series analysis density estimation and resampling methods The second half of the book is organized by statistical topic Each chapter contains examples of problems encountered astronomical research and highlights methodological issues The final chapter explores some controversial issues in astronomy that have a strong statistical component The authors provide an extensive bibliography and references to software for implementing statistical methods The marriage of astronomy and statistics is a natural one and benefits both disciplines Astronomers need the tools and methods of statistics to interpret the vast amount of data they generate and the issues related to astronomical data pose intriguing challenges for statisticians *Astrostatistics* paves the way to improved statistical analysis of astronomical data and provides a common ground for future collaboration between the two fields

Industrial Process Plants Ravi Nath, 2024-02-19 Removing the barriers to the Global Optimization of Plant Utility Systems by providing practical tools and techniques to deal with these unique challenges is the purpose of this book The operating cost of a typical Plant Utility System of a typical Industrial Production Process Plant is enormous often in tens if not hundreds of millions of dollars per Annum With so much money at stake one would expect that heroic optimization efforts would be made to reduce the operating cost however such is usually not the case One reason for this complacency is that Plant Utility Systems are usually cost centers in Process Plants and their operating cost is prorated amongst the various Production Units so it suffers from what is at times referred to as the tragedy of the commons Another reason for this complacency is that the Plant Utility System structure is significantly different than that of other Production Units as for

flexibility and safety reasons it has a large spare capacity to meet increased utility demand during startups shutdowns and emergencies The existence of a spare equipment necessitates optimization of discrete decisions whereby traditional optimization techniques do not readily apply Part of the problem is that the traditional engineering curriculum primarily emphasizes only one of the many optimization methods called Non Linear Programming NLP Although NLP can address large classes of optimization problems it has fairly stringent requirements that all describing relationships or functions be continuous and have continuous derivatives Additionally in general NLP only guarantees a local but not the global optimum Another optimization method is particularly well suited for modeling Plant Utility Systems is called Mixed Integer Linear Programming MILP And unlike NLP MILP methods can guarantee global optimum which is very reassuring MILP however does impose linearity requirements but as discussed in this book there are techniques to overcome this limitation
