4.1 Cell Division and Genetic Material

Genetics is the field of biology that involves the study of how genetic information is passed from one generation of organisms or cells to the next. Understanding genetics begins with understanding cellular processes.

The cell theory, developed in the mid-1800s, states that:

- All living things are composed of one or more cells.
- Cells are the smallest unit of a living organism (then tissue, then organs...)
- New cells come only from pre-existing cells by cell division.

ribulose
carries
DNA.

It follows from the third postulate that traits must be passed from a parent cell to new daughter cells through genetic material, in form of DNA (deoxyribonucleic acid).

The Cell Cycle

A **somatic cell** is a plant or animal cell found in the body of an organism.

All somatic cells go through cell cycles. As one cell completes a cycle, it becomes two cells. The duration of the cell cycle depends on the cell type and the organism. For most healthy, actively dividing animal cells, the cycle lasts 12 to 24 hours. (depending on cell type).

In multicellular organisms, cell division (cell cycling) has three functions:

- **Growth** of the organism
- **Repair** of tissues and organs
- **Maintenance** to replace dead cells.

Specific checkpoints in the cell cycle monitor growth to ensure the cycle continues when it should and stops when it should. Regulation is the key to preventing uncontrolled and rapid growth, such as cancerous growth.

Apoptosis - Cell death

Cell Cycle Phases

There are five phases of the cell cycle:

- **G1: Primary growth phase**
- **S: Synthesis; DNA (chromatin) replicated**
- **G2: Secondary growth phase (further growth and molecule)**
*collectively these 3 stages are called **interphase: synthesis**
- **Mitosis: nucleus and genetic material divide**
- **Cytokinesis: division of the cell cytoplasm and creation of new cells**

Mitosis

Before it divides, the cell must undergo mitosis, which is the separation of the cell's replicated genetic material. Mitosis involves the following structures:

- **chromosome:** a structure in nucleus that contain DNA
- **sister chromatid:** one of two chromosomes that are genetically identical and held together at the centromere
- **centromere:** the region where two sister chromatids are held together in a chromosome
- **spindle fibre:** a microtubule structure that facilitates the movement of chromosomes within a cell
- **centrosome:** a structure that helps to form the spindle fibers
