ENGAGE

What are your physical traits? Compare yourself to one of your friends. The differences between you are found in your genetic makeup.

EXPLORE

The human genome is a complete set of nucleic acid sequences for humans. This is comprised of the data encoded as DNA found within the 23 chromosome pairs found within the human body. There are approximately three billion base pairs of DNA that are divided into about 20,000 to 25,000 genes.

EXPLANATION

The human genome is the complete DNA sequence of a human. The human genome includes the coding regions of DNA, which are responsible for encoding the 20,000 to 25,000 genes found within the human organism. It also includes the regions of DNA that do not encode any genes. These are distributed among 24 distinct chromosomes, including 22 autosomes and the X and Y sex chromosomes. These chromosomes hold the details of the physical and molecular characteristics of the human that contains them. The organization and structure of the DNA communicates the information contained within the genome. It also gives the genome the ability to replicate, repair, and maintain itself. Put simply, the genome is all the hereditary information encoded in the DNA, including the genes and non-coding sequences.

Analysis and Enumeration Andrea Marino, 2015-03-23 In this work we plan to revise the main techniques for enumeration algorithms and to show four examples of enumeration algorithms that can be applied to efficiently deal with some biological problems modelled by using biological networks enumerating central and peripheral nodes of a network enumerating stories enumerating paths or cycles and enumerating bubbles Notice that the corresponding computational problems we define are of more general interest and our results hold in the case of arbitrary graphs

Enumerating all the most and less central vertices in a network according to their eccentricity is an example of an enumeration problem whose solutions are polynomial and can be listed in polynomial time very often in linear or almost linear time in practice

Enumerating stories i.e. all maximal directed acyclic subgraphs of a graph G whose sources and targets belong to a predefined subset of the vertices is on the other hand an example of an enumeration problem with an exponential number of solutions that can be solved by using a non trivial brute force approach

Given a metabolic network each individual story should explain how some interesting metabolites are derived from some others through a chain of reactions by keeping all alternative pathways between sources and targets

Enumerating cycles or paths in an undirected graph such as a protein protein interaction undirected network is an example of an enumeration problem in which all the solutions can be listed through an optimal algorithm i.e. the time required to list all the solutions is dominated by the time to read the graph plus the time required to print all of them

By extending this result to directed graphs it would be possible to deal more efficiently with feedback loops and signed paths analysis in signed or interaction directed graphs such as gene regulatory networks

Finally enumerating mouths or bubbles with a source s in a directed graph that is enumerating all the

two vertex disjoint directed paths between the source s and all the possible targets is an example of an enumeration problem in which all the solutions can be listed through a linear delay algorithm meaning that the delay between any two consecutive solutions is linear by turning the problem into a constrained cycle enumeration problem. Such patterns in a de Bruijn graph representation of the reads obtained by sequencing are related to polymorphisms in DNA or RNA seq data.
