2. Use the Boltzmann probability distribution curves below to predict temperatures of the mixtures of particles.

Temperature: is a measure of the average kinetic energy of the particles in a system. The kinetic energy for particles moving with v is $\frac{1}{2}mv^2$, so the more of particles that move fast enough, the more kinetic energy we will see. Temperature, therefore, is the thermally accessible kinetic energy that the particles possess as well as the distribution's maximum value to help describe the distribution's character.

3. Sketch each graph to represent the relative distribution of the particles in the following two gas samples at their same gas

- a. In System 1, it is a higher or lower temperature than System 2? Justify your answer.
System 1 is at a lower temperature than System 2. Temperature is a measure of the average KE of the particles in the system. In System 1, the gas particles are at a lower mass, and all the individual particles have the same mass. According to the equation $KE = \frac{1}{2}mv^2$, all of the particles have the same mass, so the more velocity they possess, KE. In the particles in System 1, all are smaller, which particles are moving at slower velocities and therefore is lower energy.
- b. Are either different with kinetic energy for System 2? Justify your answer in terms of molecular collisions.
All gas has a different mass than System 2, so System 1 is at a lower temperature. Temperature is a measure of the average KE of the particles in the system at a given temperature. Therefore, temperature is the same for both molecules that make up the gas, and the molecular mass and velocity are the same for both gases. This molecular mass and velocity are the same for both gases.
