

Genetic Mutations POGIL Answer Key Latest 2023/2024 (Verified Answers) 100% Correct

How many nucleotides are a part of a codon?

3

Does an mRNA sequence that codes for "stop" actually count as an amino acid?

no

What is the result of a substitution mutation?

ONE codon changes which causes ONE amino acid to be different from the normal amino acid sequence

What is an insertion mutation?

An additional nucleotide is inserted in the normal sequence, which lengthens the sequence

What is a deletion mutation?

An existing nucleotide is removed in the normal sequence, which shortens the sequence

Would all substitution mutations lead to a change in the amino acid sequence?

No because if the last letter in a codon changed, the same amino acid is expressed than if the last nucleotide had not been changed.

Would all insertion or deletion mutations lead to a change in the amino acid sequence?

Yes because any new nucleotide that is inserted / deleted shifts the nucleotides, changing the letters of multiple codons.

Would a substitution or insertion mutation pose more damage (or a greater benefit) to an organism?

Insertion because it has the potential to change a majority of the normal amino acid sequence, as the reading frame shifts.

Would a deletion mutation at the beginning of a DNA sequence or at the end pose more damage (or a greater benefit) to an organism?

The beginning because the codons following would all change, whereas a deletion mutation at the end would not affect the codons that were present before.

What is the range of changes in the amino acid sequence that can result from a substitution mutation?

One amino acid may change but the others can remain the same; the amino acid sequence may be stopped too early; no protein will be translated because of a lack of a start codon

Gene mutations can be _____ or _____

missense or nonsense

Gene mutations can be _____ or _____ or _____

positive, negative, neutral

What are missense mutations?

An amino acid is still produced but the wrong amino acid is produced

What are nonsense mutations?

No amino acid is produced; causes a stop codon to occur

What is a neutral mutation?

The sequence is mutated but the same amino acid sequence is produced as the "normal" one

What is a positive mutation?

Human Gene Mutation David Neil Cooper, Michael Krawczak, 1993 Within the last decade much progress has been made in the analysis and diagnosis of human inherited disease and in the characterization of the underlying genes and their associated pathological lesions *Mutations in Human Genetic Disease* David Cooper, Jian-Min Chen, 2012-10-12 Different types of mutation can vary in size from structural variants to single base pair substitutions but what they all have in common is that their nature size and location are often determined either by specific characteristics of the local DNA sequence environment or by higher order features of the genomic architecture The genomes of higher organisms are now known to contain pervasive architectural flaws in that certain DNA sequences are inherently mutation prone by virtue of their base composition sequence repetitivity and or epigenetic modification In this volume a number of different authors from diverse backgrounds describe how the nature location and frequency of different types of mutation causing inherited disease are shaped in large part and often in remarkably predictable ways by the local DNA sequence environment *Understanding the Impact of Gene mutation on Health & Diseases. An Overview.* Dr. HAKIM, 2020-04-09 Each cell depends on thousands of proteins to do their jobs in the right places at the right times to function correctly Sometimes gene mutations prevent one or more of these proteins from working properly By changing a gene's instructions for making a protein a mutation can cause the protein to malfunction or to be missing entirely When a mutation alters a protein that plays a critical role in the body it can disrupt normal development or cause a medical condition A condition caused by mutations in one or more genes is called a genetic disorder In some cases gene mutations are so severe that they prevent an embryo from surviving until birth These changes occur in genes that are essential for development and often disrupt the development of an embryo in its earliest stages Because these mutations have very serious effects they are incompatible with life It is important to note that genes themselves do not cause disease genetic disorders are caused by mutations that make a gene function improperly For example when people say that someone has the cystic fibrosis gene they are usually referring to a mutated version of the CFTR gene which causes the disease All people including those without cystic fibrosis have a version of the CFTR gene An attempt has been made in this informative Booklet to summarize the fundamental topics related to genetic mutations and its impact on health and development along with several illustrations Dr H K Saboowala M B Bom M R S H London

deleterious mutations in the human genome and their effects on human health and wellbeing Despite all of the elaborate mechanisms that a cell employs to handle its DNA with the utmost care a newborn human carries about 100 new mutations originated in their parents about 10 of which are deleterious A mutation replacing just one of the more than three billion nucleotides in the human genome may lead to synthesis of a dysfunctional protein and this can be inconsistent with life or cause a tragic disease Several percent of even young people suffer from diseases that are caused exclusively or primarily by pre existing and new mutations in their genomes including both a wide variety of genetically simple Mendelian diseases and diverse complex diseases such as birth anomalies diabetes and schizophrenia Milder but still substantial negative effects of
