Information on the availability of Internet is reported along with the other socio-economic characteristics of the population.

Figure 1 illustrates the study design. The participants received the treatment (training) in the first 10 days of the study, followed by a 10-day washout period, and then the control (no training) condition for the next 10 days. The participants were then randomly assigned to either the training or control condition for the next 10 days. The participants were then randomly assigned to either the training or control condition for the next 10 days.

Abstract—This study provides information on the health-related quality of life (HRQL) of the Canadian Inuit population. The Inuit population is the largest indigenous group in Canada, and is distributed across the northern and central regions of the country. The Inuit population is characterized by a high prevalence of chronic diseases, and a high rate of unemployment. The purpose of this study was to assess the HRQL of the Inuit population, and to identify the factors that are associated with poor HRQL. The study was conducted in two phases. In the first phase, a cross-sectional survey was conducted in 1998, and in the second phase, a longitudinal survey was conducted in 2000. The study was conducted in two regions: the Northwest Territories (NWT) and Nunavut. The study was conducted in two communities: Inuvik and Repulse. The study was conducted in two groups: the Inuit population and the non-Inuit population. The study was conducted in two groups: the Inuit population and the non-Inuit population. The study was conducted in two groups: the Inuit population and the non-Inuit population.
