

1.1 Operating System and Function

An *operating system (OS)* is a program that controls the execution of application programs and acts as an interface between applications and the computer hardware.

Examples: Microsoft Windows, Apple macOS, Linux OS, Unix OS.

An OS has three main objectives:

- i. An operating system should make the computer more convenient to use.
- ii. An operating system should use the hardware efficiently.
- iii. An OS should allow the development, testing, and introduction of new functions.

An operating system has two basic functions:

1. Resource management

- Process management
- Memory management
- I/O device management
- File management

2. Virtual machine management

1. The Operating System as Resource Manager

Computer systems consist of different hardware and software as resources such as processors, memory, timers, disks, n/w interfaces and so on. Each of these resources has its own functionality and usage which needs to be managed and piled up to make whole computer system work efficiently and complete the given task. So, OS is the one which manages all the resources providing an ordered and controlled allocation of resources among various programs.
