**Agronomic Crops** Mirza Hasanuzzaman,2019-11-23 Agronomic crops have provided food beverages fodder fuel medicine and industrial raw materials since the beginning of human civilization More recently agronomic crops have been cultivated using scientific rather than traditional methods However in the current era of climate change agronomic crops are suffering from different environmental stresses that result in substantial yield loss To meet the food demands of the ever increasing global population new technologies and management practices are being adopted to boost yields and maintain productivity under both normal and adverse conditions Further in the context of sustainable agronomic crop production scientists are adopting new

approaches such as varietal development soil management nutrient and water management and pest management Researchers have also made remarkable advances in developing stress tolerance in crops However the search for appropriate solutions for optimal production to meet the increasing food demand is still ongoing Although there are several publications on the recent advances in these areas there are few comprehensive resources available covering all of the recent topics This timely book examines all aspects of production technologies management practices and stress tolerance of agronomic crops

**Seed Dormancy and Germination** Jose Carlos Jimenez-Lopez,2020-01-08 Seed dormancy and germination are critical processes for the development of plants Seed dormancy allows seeds to overcome harsh periods of seedling establishment and is also important for plant agriculture and crop yield Several processes are involved in the induction of dormancy and in the shift from the dormant to the germinating state and hormones and regulatory genetic networks are among the critical factors driving these complex processes Germination can be prevented by different factors leading to seed dormancy which is highly dependent on environmental cues During and after germination early seedling growth is sustained by catabolism of stored reserves proteins lipids or starch accumulated during seed maturation supporting cell morphogenesis chloroplast development and root growth until photo auxotrophic growth can be resumed
