The mean mark on this paper was 22.9 with a standard deviation of 6.2. Only 56 out of 4600 candidates were completely out of their depth, scoring less than the guessing mark of 10.

Questions 7, 11, 20, 36, 37 and 38 were found to be particularly straightforward, with no subtle twists for the candidate to worry about or to ignore.

Candidates did well to sort out **Question 5**. 78% got the correct answer. They were less successful with the unusual presentation of **Question 6** where only 51% were successful. As might have been expected, **Question 9** proved difficult with only 29% being successful. This does need careful analysis and the temptation is to guess. It is essential here to incorporate the elastic collision situation of velocity of approach being equal to the velocity of separation.

A disappointing 45% gave the correct answer to **Question 12**. Many thought that R_2 would be less than R_1 . **Questions 13, 14 and 15** were all poorly answered. This was understandable for **Question 13** where the torque is provided by just the top part of the belt, so radius is required rather than diameter, but **Question 14** should have been answered more reliably. It was probably the resolution aspect that caused the difficulty here. There was no doubt in **Question 15** that too many people concentrated only on the 2 kg trolley. Only 13% correctly applied the conservation of momentum first and then found the kinetic energy to be 12 J.
