

Unit 6: Thermochemistry**6.1: Heat Transfer and Thermal Equilibrium****6.2: Heat Capacity and Calorimetry****6.3: Entropy and Free-Energy Changes**

2. Use the Boltzmann-probability distribution curves below to predict temperatures of the mixtures of particles.

Temperature: is a measure of the average kinetic energy of the particles in a system. The kinetic energy for particles moving 100 m/s is 100 J . The first mixing of particles and molecules from one change, instantly increased the set of temperatures, therefore, the Boltzmann distribution curve equal that the average velocity of each set of the distribution's molecules (from the change) the average temperature increases.

3. Sketch each graph to represent the relative distribution of the particles in the following two parts: samples of the same gas.

- a. In System 1, it is a higher or lower temperature than System 2? Justify your answer.
System 1 is at a lower temperature than System 2. Temperature is a measure of the average KE of the particles in the system. In System 1, the particles are more closely packed, and all the individual particles have the same mass. According to the equation $KE = \frac{1}{2}mv^2$, all the particles have the same mass, so the only way to have a higher KE is if the particles in System 1 are moving faster. Since particles are moving at slower velocities, the average is lower.
- b. In which direction will thermal energy be transferred? Justify your answer in terms of molecular collisions.
All heat is transferred from System 1 to System 2. The particles in System 1 are moving at lower velocities, so the average kinetic energy of the particles is lower. The particles in System 2 are moving at higher velocities, so the average kinetic energy of the particles is higher. The molecules in System 1 are moving at lower velocities, so the average kinetic energy of the particles is lower. The molecules in System 2 are moving at higher velocities, so the average kinetic energy of the particles is higher.
