

Analysis of a Squirrel Gene Pool

Suppose that, after a natural disaster, a small population of 2000 squirrels was left behind. Between 1970 and 1990, they existed as three isolated colonies, each with its own unique characteristics. These included the frequency of color and shape features that were inherited, isolated from movement of the other populations. In 1990, environmental conditions changed. The populations were no longer isolated. The colonies were in direct contact, and the populations began to interbreed. Genetic drift and natural selection began to operate on the combined population. Over time, the populations began to diverge again, and the genetic pool began to change. The populations began to diverge again, and the genetic pool began to change.

Organisms may have different phenotypes of the same trait.
