Kerckhoffs, 2010-09-03 Peter Hunter Computational physiology for the cardiovascular system is entering a new and exciting phase of clinical application Biophysically based models of the human heart and circulation based on patient specific anatomy but also informed by po lation atlases and incorporating a great deal

of mechanistic understanding at the cell tissue and organ levels offer the prospect of evidence based diagnosis and treatment of cardiovascular disease The clinical value of patient specific modeling is well illustrated in application areas where model based interpretation of clinical images allows a more precise analysis of disease processes than can otherwise be achieved For example Chap 6 in this volume by Speelman et al deals with the very difficult problem of trying to predict whether and when an abdominal aortic aneurysm might burst This requires automated segmentation of the vascular geometry from magnetic resonance images and finite element analysis of wall stress using large deformation elasticity theory applied to the geometric model created from the segmentation The time varying normal and shear stress acting on the arterial wall is estimated from the arterial pressure and flow distributions Thrombus formation is identified as a potentially important contributor to changed material properties of the arterial wall Understanding how the wall adapts and remodels its material properties in the face of changes in both the stress loading and blood constituents associated with inflammatory processes IL6 CRP MMPs etc
