Structure of Sound Dik J. Hermes, 2023-06-10 This book presents a comprehensive review of how acoustic waves are processed by the auditory system into structured sounds such as musical melodies speech utterances or environmental sounds After an introduction an overview is given of how the ears distribute acoustic information over a large array of frequency channels that contain the auditory information used by the central nervous system to generate a mental image of what is happening around the listener This process called auditory scene analysis consists of two stages In the first stage auditory units are formed such as musical tones and speech syllables Each auditory unit is perceived at a well defined moment in time the beat location of that auditory unit Moreover from this process of auditory unit formation the auditory attributes of these auditory units emerge such as their timbre their pitch their loudness and their perceived location Each of

these attributes is discussed in the corresponding chapter In the second stage of auditory scene analysis auditory stream formation the successive auditory units are integrated into auditory streams i e temporally structured sequences of auditory units that are perceived as emanating from one and the same sound source Examples of such auditory streams are musical melodies and the utterances of one speaker The temporal structure of an auditory stream its rhythm is determined by the beat locations of its auditory units The role played by the auditory attributes of the consecutive auditory units is discussed The melodies of musical streams and the intonation contours of spoken utterances emerge from this process In music the beats of parallel streams generally fit into a metric pattern and depending on harmony simultaneous tones can be perceived as consonant or dissonant Finally the book contains many sound examples including the MATLAB scripts with which they are generated

Mechanisms: Structure, Function, and Models J. Wilson, 2012-12-06 Great advances have been made in understanding hearing in recent years In particular the mechanical function of the cochlea has become the focus of intense interest This started in one direction with the discovery of otoacoustic emissions in 1978 which required active mechanical amplification processes as first postulated by Gold in 1948 Direct evidence for the role of this mechanism in sharpening up the otherwise poor basilar membrane tuning properties was provided in 1982 and in 1983 motility was shown in outer hair cells In parallel an immense amount of work has been done on the electrophysiology of hair cells following the first intracellular recordings in 1977 Over a longer time scale models of basilar membrane motion have been developed and refined and recently much effort has been put into incorporating active mechanisms and non linear processes It seemed an opportune time to bring together the leading workers in these various areas to take stock of the whole field and to stimulate further progress This book represents the proceedings of a NATO ARW on the Mechanics of Hearing held at the University of Keele 3-8 July 1988 The conception of the meeting owes much to earlier meetings held in Boston in 1985 *Peripheral Auditory Mechanisms* Eds J B Allen J L *Study Guide for Memmler's Structure & Function of the Human Body, Enhanced Edition* Kerry L.
