

which the water in cup B radiated heat was greater.

- Answers may vary. Sample: You should let the hot chocolate sit for five minutes and then add the ice cube. By letting the hot chocolate radiate first, the difference in temperature between the hot chocolate and the room is greater than if you added the ice cube immediately. Therefore, the hot chocolate will cool faster.
- Answers may vary. Sample: Pancakes that are immediately covered in syrup will stay warm longer. The syrup will decrease the temperature difference between the pancakes and the room so that they will not radiate heat as quickly.

Section 6-3 Review and Reinforce (p. 159)

- The solid ice absorbed thermal energy from its surroundings and changed state, or melted, to become liquid water.
- When a substance is changing state, its thermal energy is changing but its temperature remains the same. That's because the change in thermal energy is changing the arrangement of the particles, but the average kinetic energy of those particles is not changing.

solder in a sprinkler should melt first, so the solder should have the lowest melting point.

- The glass expands less than the liquid inside it because the expansion of the liquid causes the glass to break.
- If each sprinkler is set off individually, only the area of the fire will be sprayed and less water damage will occur.
- Heat moves to the sprinkler by radiation and by convection.
- If sprinklers were designed to go off a few degrees above room temperature, they could go off for reasons other than a fire, such as if the building's temperature rose due to a broken air conditioner.
