rearrangements Thus it seems at least plausible that TEs may play a significant role in the adaptation and evolution of natural populations and species The ubiquity of TEs suggests that they are an old component of genomes which have been vertically transmitted through generations over evolutionary time However detailed analyses carried out over the last 20 years have revealed several unusual features of TE evolution i TEs can be horizontally transferred between species ii TE evolutionary rates can be dramatically increased by specific inactivation processes such as the RIP Repeat Induced Point mutation mechanism in fungi iii TEs can influence the regulation of other TEs by insertion or deletion iv different classes of TEs in even distantly related species can be remarkably similar in both structure and function
