Handbook of Texture Analysis Ayman El-Baz,Mohammad Ghazal,Jasjit S. Suri,2024-06-24 The major goals of texture research in computer vision are to understand model and process texture and ultimately to simulate the human visual learning process using computer technologies In the last decade artificial intelligence has been revolutionized by machine learning and big data approaches outperforming human prediction on a wide range of problems In particular deep learning convolutional neural networks CNNs are particularly well suited to texture analysis This book examines four major application domains related to texture analysis and their relationship to AI based industrial applications texture classification texture segmentation shape from texture and texture synthesis This volume Discusses texture based segmentation for extracting image shape features modeling and segmentation of noisy and textured images spatially constrained color texture model for image segmentation and texture segmentation using Gabor filters Examines textural features for image classification a statistical approach for classification texture classification from random features and applications of texture classifications Describes shape from texture including general principles 3D shapes and equations for recovering shape from texture Surveys texture modeling including extraction based on Hough transformation and cycle detection image quilting gray level run lengths and use of Markov random fields Aimed at researchers academics and advanced students in biomedical engineering image analysis cognitive science and computer science and engineering this is an essential reference for those looking to advance their understanding in this applied and emergent field

Handbook of Magnetic Materials K.H.J. Buschow,2002-09-20 Magnetoelectronics is a novel and rapidly developing field This new field is frequently referred to as spin electronics or spintronics It includes spin utilizing devices that need neither a magnetic field nor magnetic materials In semiconductor devices the spin of the carriers has only played a very modest role so far because well established semiconductor devices are non magnetic and show only negligible effects of spin Nanoscale thin films and multilayers nanocrystalline magnetic materials granular films and amorphous alloys have attracted much attention in the last few decades in the field of basic research as well as in the broader field of materials science Such heterogeneous materials display uncommon magnetic properties that virtually do not occur in bulk materials This is true in particular with respect to surface interface magnetic anisotropy and surface interface magnetostrictive strains and giant magnetoresistance The local

atomic arrangement at the interface differs strongly from that in the bulk. The local symmetry is lowered so that some interactions are changed or are missing altogether. The interface atoms may be envisaged as forming a new phase and some properties characteristic of this phase may become predominant for the entire system. This becomes particularly evident in the case of interfacial magnetostriction which can lead to a decrease almost to zero or to an increase over the bulk value of the resulting magnetostriction of the nanoscale system. There are various forms of the interplay of magnetism and superconductivity which can be divided into competition and coexistence phenomena. For instance a strong competition is found in high T_c cuprates. In these materials depending on the doping rate either Neel type antiferromagnetism moments e.g. from 4f elements with superconductivity is known to occur in systems where the concentration of these moments is sufficiently small or where they are antiferromagnetically ordered and only weakly coupled to the conduction electrons. During the years intermetallic gadolinium compounds have adopted a special position in the study of 4f electron magnetism. The reason for this is the fact that the gadolinium moment consists only of a pure spin moment orbital contributions to the moment being absent. As a consequence gadolinium compounds have been regarded as ideal test benches for studying exchange interactions free from complications due to crystal effects. Volume 14 of the Handbook of Magnetic Materials as the preceding volumes has a dual purpose. As a textbook it is intended to be of assistance to those who wish to be introduced to a given topic in the field of magnetism without the need to read the vast amount of literature published. As a work of reference it is intended for scientists active in magnetism research. To this dual purpose volume 14 of the Handbook is composed of topical review articles written by leading authorities. In each of these articles an extensive description is given in graphical as well as tabular form much emphasis being placed on the discussion of the experimental material in the framework of physics chemistry and material science.
