Unraveling the functional properties of structural elements in the brain is one of the fundamental goals of neuroscientific research In the cerebral cortex this is no mean feat since cortical areas are defined microstructurally in post mortem brains but functionally in living brains with electrophysiological or neuroimaging techniques and cortical areas vary in their

topographical properties across individual brains Being able to map both microstructure and function in the same brains noninvasively in vivo would represent a huge leap forward In recent years high field magnetic resonance imaging MRI technologies with spatial resolution below 0.5 mm have set the stage for this by detecting structural differences within the human cerebral cortex beyond the Stria of Gennari This provides the basis for an in vivo microanatomical brain map with the enormous potential to make direct correlations between microstructure and function in living human brains This book starts with Brodmann's post mortem map published in the early 20th century moves on to the almost forgotten microstructural maps of von Economo and Koskinas and the Vogt Vogt school sheds some light on more recent approaches that aim at mapping cortical areas noninvasively in living human brains and culminates with the concept of in vivo Brodmann mapping using high field MRI which was introduced in the early 21st century

An Update on Neurocognitive Impairment in Schizophrenia and Depression Kenneth Hugdahl, Vince D. Calhoun, 2012-05-01 Despite all research that has been devoted to schizophrenia over the last years the understanding of the biological bases of the disorder is still fragmentary Adding to the complexity is the realization that basic cognitive functions

are seriously distorted and that removal of symptoms does not necessarily ameliorate the cognitive deficits. It has also been shown that cognitive deficits can occur before clinical symptoms in a prodromal phase of the disorder, pointing to a possible causal relationship between cognitive deficits and outbreak of the disorder. However, it is still not possible to diagnose a patient from cognitive deficits alone or from a combination of clinical symptoms and cognitive deficits and structural and functional neuroimaging data, although promising, have also not found the way to routine clinical practice. The aim of the Research Topic is therefore to provide an update on research on cognitive and brain imaging research for the understanding of cognitive deficits in schizophrenia. The suggested contributors are all internationally recognized experts in their respective fields. The suggested contributions will cover the field from the use of standardized neuropsychological tests to establish cognitive response profiles in patients with schizophrenia to the use of advanced new techniques for the analysis of brain imaging data.
