The Revolutions Of Scientific Structure Colin G Hales,2014-07-07 This book discusses two main cultural problems behind the failure of machine consciousness and artificial general intelligence AGI projects over many decades The first problem recognizes that building a conscious AGI means building an artificial scientist The book identifies the responsible pitfalls in mainstream scientific behavior and eliminates them by proposing a new operational framework for scientists called Dual Aspect Science The second problem arises because scholars involved in machine consciousness and AGI essentially aim to replicate brains with computers They are demonstrably not doing this and this failure has been prevalent since the rise of computers Instead the book discusses the possibility of doing real empirical neuroscience by means of artificial materials that literally do what the brain does Inspired by Thomas Kuhn one of the most influential philosophers of science of the twentieth century this compendium proposes a fresh perspective on machine consciousness on AGI and more generally on how the machinery of science might need to change to accommodate it

Physical Properties and Thermodynamic Behaviour of Minerals Ekhard K.H. Salje,2012-12-06 The role played by earth sciences in the scientific community has changed considerably during this century Since the revolutionary discoveries of global processes such as plate tectonics there has been an increasing awareness of just how fundamental many of the mechanisms which dominate in these processes depend on the physical properties of the materials of which the earth is made One of the prime objectives of mineral sciences is now to understand and predict these properties in a truly quantitative manner The macroscopic properties which are of most immediate interest in this context fall within the conventional definitions of thermodynamics magnetism elasticity dielectric susceptibilities conductivity etc These properties reflect the microscopic contributions at an atomistic level of harmonic and anharmonic lattice vibrations ionic and electronic transport as well as a great variety of ordering and clustering phenomena The advances made by solid state physicists and chemists in defining the underlying phenomena Involved in the thermal evolution of materials have stimulated major new research initiatives within the Earth Sciences Earth Scientists have combined to form active groups within the wider community of solid state and materials scientists working towards a better understanding of those physical processes which govern not only the behaviour of simple model compounds but also that of complex materials like minerals Concomitant with this change in direction has come an increasing awareness of the need to use the typical working tools of other disciplines
