### ANATOMY AND PHYSIOLOGY

Understanding the structure and function of the human body is essential for understanding health and disease. This guide provides a comprehensive overview of the human body, from the basic structures of the cells to the complex systems of the organs.

**Cells and Tissues:** The basic units of life are cells. Cells are made of tissues, which are groups of cells that work together to perform a specific function. The four main types of tissues are epithelial, connective, muscle, and nervous.

**Organs and Systems:** Organs are made of tissues. The human body is divided into several systems, each with its own set of organs. The main systems are the skeletal, muscular, cardiovascular, respiratory, digestive, excretory, reproductive, endocrine, nervous, and sensory systems.

**Homeostasis:** The body maintains a stable internal environment through a process called homeostasis. This involves the body's ability to detect changes in the environment and respond to them in a way that keeps the body in balance.

**Health and Disease:** Understanding the human body is essential for understanding health and disease. This guide provides a comprehensive overview of the human body, from the basic structures of the cells to the complex systems of the organs.
