

PHYSICS C: ELECTRICITY AND MAGNETISM

SECTION II

Time—45 minutes

3 Questions

Directions: Answer all three questions. The suggested time is about 15 minutes for answering each of the questions, which are worth 15 points each. The parts within a question may not have equal weight. Show all your work in this booklet in the spaces provided after each part.

1. Students design an experiment to determine the unknown dielectric constant κ of a plastic material. A capacitor is created using two square aluminum plates of side length $s = 30$ cm that are separated by a distance $d = 1.0$ mm. This capacitor is placed in a circuit with an ideal 6.0-volt battery, a resistor of resistance $R = 500\ \Omega$, voltmeter V , and an open switch S , as shown above. A 1.0 mm thick piece of plastic is inserted between the aluminum plates. The distance x that the plastic is inserted between the plates can be varied, and the voltmeter is used to measure the potential difference V_C across the capacitor. The switch is closed, and readings from the voltmeter are recorded as a function of time t . The data are plotted to create the graph shown below.

The time $t_{1/2}$ shown above is the time for the capacitor to charge to half the potential difference of the battery.

- (a) The potential difference across the capacitor as a function of time is modeled by the equation $V_C = V_{\text{MAX}}(1 - e^{-t/RC})$, where $V_{\text{MAX}} = 6$ V. Derive an expression for the capacitance C of the capacitor. Express your answer in terms of $t_{1/2}$, R , and physical constants, as appropriate.
