Mendelian/Human Genetics

Introduction

Gregor Mendel is often considered the “father” of modern genetic analysis. His pioneering work with garden peas provided the evidence from which he deduced the primary modes of inheritance of individual genes, often called “Mendelian Genetics.” The primary hypotheses/ideas Mendel described are as follows:

- Genes exist in pairs in diploid organisms
 - The genes can contain different information called alleles (for example, an eye color gene may contain either a brown-eye allele or a blue-eye allele)
 - Of these allele pairs, some alleles are dominant and some are recessive
 - Alleles for the same gene segregate independently of each other during meiosis (this is Mendel’s **law of segregation**)
- When following the inheritance of the alleles of two different genes (for example, eye color and height), Mendel devised the **law of independent assortment**:
 - Alleles for different genes segregate independently of each other during meiosis

The study of genetics relies on a significant amount of vocabulary, and in order to understand and apply genetic principles, a detailed understanding of this vocabulary is required.

- Useful genetics vocabulary includes
 - Homozygous and heterozygous
 - Genotype and phenotype
 - Monohybrid and dihybrid crosses
 - Testcross

In addition, the use of the principles of simple probability can provide an extensive amount of information on how different traits are inherited. Comprehending genetics involves a basic understanding and appreciation of how genes regulate our various traits (dimples, hair color, blood types, for example). The **goal** of this lab is to provide a “**genetics sampler**” or **relatively simple introduction to heredity using common human traits**.

Learning Objectives

1. To define some genetic terms: allele, dominant, recessive, genotype, phenotype, heterozygous, and homozygous.
2. To gain practice working simple genetics problems, using a Punnett square.
3. To observe selected human phenotypes and determine their genotypes.

Materials

- PTC (phenylthiocarbamide) taste strips
- Sodium benzoate taste strips
- Chart for tabulation of class results of human phenotype/genotype determination.
- Blood typing supplies
 - Anti-A and Anti-B sera, slides, toothpicks, sterile lancet, wax pencils, alcohol swabs
 - Beaker containing 10% bleach solution
 - Disposable waste bags
