Cox,Andrea Benucci, R. Clay Reid,2015-11-18 Vision is the process of extracting behaviorally relevant information from patterns of light that fall on retina as the eyes sample the outside world Traditionally nonhuman primates macaque monkeys in particular have been viewed by many as the animal

model of choice for investigating the neuronal substrates of visual processing not only because their visual systems closely mirror our own but also because it is often assumed that simpler brains lack advanced visual processing machinery. However, this narrow view of visual neuroscience ignores the fact that vision is widely distributed throughout the animal kingdom, enabling a wide repertoire of complex behaviors in species from insects to birds, fish, and mammals. Recent years have seen a resurgence of interest in alternative animal models for vision research, especially rodents. This resurgence is partly due to the availability of increasingly powerful experimental approaches, e.g., optogenetics and two-photon imaging, that are challenging to apply to their full potential in primates. Meanwhile, even more phylogenetically distant species, such as birds, fish, and insects, have long been workhorse animal models for gaining insight into the core computations underlying visual processing. In many cases, these animal models are valuable precisely because their visual systems are simpler than the primate visual system. Simpler systems are often easier to understand, and studying a diversity of neuronal systems that achieve similar functions can focus attention on those computational principles that are universal and essential. This Research Topic provides a survey of the state of the art in the use of animal models of visual functions that are alternative to macaques. It includes original research methods, articles, reviews, and opinions that exploit a variety of animal models, including rodents, birds, fishes, and insects, as well as small New World monkeys, the marmoset, to investigate visual function. The experimental approaches covered by these studies range from psychophysics and electrophysiology to histology and genetics, testifying to the richness and depth of visual neuroscience in non-macaque species.

Progress in Biological Cybernetics Research Daan A. De Jong, 2008. Topics covered include experimental studies of biological systems, including quantitative modelling, computational, technical, or theoretical studies with relevance for understanding biological information processing and artificial implementation of biological information processing and self-organising principles.

Transforming Communication in Leadership and Teamwork Renate Motschnig, David Ryback, 2016-11-07. This accessible, highly interactive book presents a transformative approach to communication in leadership to meet workplace challenges at both local and global levels. Informed by neuroscience, psychology, as well as leadership science, it explains how integrating and properly balancing two key focal points of management—the tasks at hand and the concerns of others and self—can facilitate decision making, partnering with diverse colleagues, and handling of crises and conflicts. Case examples, a self-test, friendly calls for reflection, and practical exercises provide readers with varied opportunities to assess support and evoke their readiness to apply these real-world concepts to their own style and preferences. Together, these chapters demonstrate the best outcomes of collaborative communication: greater effectiveness, deeper empathy, with improved emotional fulfillment and lasting positive change.
