Investigations in Algebraic Theory of Combinatorial Objects I.A. Faradzev, A.A. Ivanov, M. Klin, A.J. Woldar, 2013-06-29 X K chendorffer L A Kalu lnin and their students in the 50s and 60s Nowadays the most deeply developed is the theory of binary invariant relations and their combinatorial approximations These combinatorial approximations arose repeatedly during this century under various names Hecke algebras centralizer rings association schemes coherent configurations cellular rings etc see the first paper of the collection for details and in various branches of mathematics both pure and applied One of these approximations the theory of cellular rings cellular algebras was developed at the end of the 60s by B Yu Weisfeiler and A A Leman in the course of the first serious attempt to study the complexity of the graph isomorphism problem one of the central problems in the modern theory of combinatorial algorithms At roughly the same time G M Adelson Velskir V L Arlazarov I A Faradtev and their colleagues had developed a rather efficient tool for the constructive enumeration of combinatorial objects based on the branch and bound method By means of this tool a number of sports like results were obtained Some of these results are still unsurpassed

be the first of a series deserves to be explained The subject the theory and the practice of computation in algebraic geometry and related domains from the mathematical viewpoint has been one of the themes of the symposia organized by SIGSAM the Special Interest Group for Symbolic and Algebraic Manipulation of the Association for Computing Machinery SAME Symbolic and Algebraic Manipulation in Europe and AAEEC the semantics of the name is varying an average meaning is Applied Algebra and Error Correcting Codes *Quantum Probability And Infinite Dimensional Analysis: From Foundations To Applications* Uwe Franz, Michael Schürmann, 2005-01-12 This volume collects research papers in quantum probability and related fields and reflects the recent developments in quantum probability ranging from the foundations to its applications

Mathematical Investigations Phil DeMarois, Mercedes A. McGowen, Darlene Whitkanack, 2001 Reflective of AMATYC and NCTM standards for teaching mathematics this text the first in a series of two texts aims to make mathematics truly accessible to all students by taking an active approach to learning Focused on mathematical reasoning and problem solving strategies Mathematical Investigations presents a series of carefully sequenced investigations where students gather data and work collaboratively to discover key concepts The function concept is central to all topics from Chapter 3 forward and is explored through multiple representations This text explores variables notation and processes explicitly rather than assuming students have mastered these concepts in previous courses Content is explored in depth and contextual problems are revisited throughout the text to create a spiral that gives students multiple opportunities to master important skills and concepts Graphing calculators are integrated throughout the text to help students discover patterns and interpret data intelligently Students construct their knowledge of a particular topic in a real world context and then reinforce this knowledge through reflection practice and synthesis with other topics as they work through the text *Homological and Computational Methods in Commutative Algebra* Aldo Conca, Joseph Gubeladze, Tim Römer, 2017-11-16 This volume collects contributions by leading experts in the area of commutative algebra related to the INdAM meeting Homological and Computational Methods in Commutative Algebra held in Cortona Italy from May 30 to June 3 2016 The conference and this volume are dedicated to Winfried Bruns on the occasion of his 70th birthday In particular the topics of this book strongly reflect the variety of Winfried Bruns research interests and his great impact on commutative algebra as well as its applications to related fields The authors discuss recent and relevant developments in algebraic geometry commutative algebra computational algebra discrete geometry and homological algebra The book offers a unique resource both for young and more experienced researchers seeking comprehensive overviews and extensive bibliographic references **Using Algebraic Geometry** David A. Cox, John Little, DONAL OSHEA, 2013-04-17 In recent years the discovery of new algorithms for dealing with polynomial equations coupled with their implementation on fast inexpensive computers has sparked a minor revolution in the study and practice of algebraic geometry These algorithmic methods have also given rise to some exciting new applications of algebraic geometry This book illustrates the many uses of algebraic geometry highlighting some of the

more recent applications of Grobner bases and resultants In order to do this the authors provide an introduction to some algebraic objects and techniques which are more advanced than one typically encounters in a first course but nonetheless of great utility The book is written for nonspecialists and for readers with a diverse range of backgrounds It assumes knowledge of the material covered in a standard undergraduate course in abstract algebra and it would help to have some previous exposure to Grobner bases The book does not assume the reader is familiar with more advanced concepts such as modules

Current Trends on Monomial and Binomial Ideals Huy Tài Hà, Takayuki Hibi, 2020-03-18 Historically the study of monomial ideals became fashionable after the pioneering work by Richard Stanley in 1975 on the upper bound conjecture for spheres On the other hand since the early 1990s under the strong influence of Gröbner bases binomial ideals became gradually fashionable in commutative algebra The last ten years have seen a surge of research work in the study of monomial and binomial ideals Remarkable developments in for example finite free resolutions syzygies Hilbert functions toric rings as well as cohomological invariants of ordinary powers and symbolic powers of monomial and binomial ideals have been brought forward The theory of monomial and binomial ideals has many benefits from combinatorics and Gröbner bases Simultaneously monomial and binomial ideals have created new and exciting aspects of combinatorics and Gröbner bases In the present Special Issue particular attention was paid to monomial and binomial ideals arising from combinatorial objects including finite graphs simplicial complexes lattice polytopes and finite partially ordered sets because there is a rich and intimate relationship between algebraic properties and invariants of these classes of ideals and the combinatorial structures of their

Linear Ray and Wave Optics in Phase Space Amalia Torre, 2005-11-11 Ray wave and quantum concepts are central to diverse and seemingly incompatible models of light Each model particularizes a specific manifestation of light and then corresponds to adequate physical assumptions and formal approximations whose domains of applicability are well established Accordingly each model comprises its own set of geometric and dynamic postulates with the pertinent mathematical means At a basic level the book is a complete introduction to the Wigner optics which bridges between ray and wave optics offering the optical phase space as the ambience and the Wigner function based technique as the mathematical machinery to accommodate between the two opposite extremes of light representation the localized ray of geometrical optics and the unlocalized wave function of wave optics At a parallel level the analogies with other branches of both classical and quantum physics like classical and quantum mechanics quantum optics signal theory as well as magnetic optics are evidenced by pertinent comments and or rigorous mathematics So the Lie algebra and group methods are introduced and explained through the elementary optical systems within both the ray and wave optics contexts the former being related to the symplectic group and the latter to the metaplectic group In a like manner the Wigner function is introduced by following the original issue to individualize a phase space representation of quantum mechanics which is mirrored by the issue to individualize a local frequency spectrum within the signal theory context The basic analogy with the optics of charged particles inherently underlying the ray optics picture in phase space is also evidenced within the wave optics picture in the Wigner phase space amalgamation of a great deal of contributions having witnessed the phase space picture of optics over the past 30 years introduces abstract concepts through concrete systems hosts of figures and logical diagrams to favour intuition and to introduce mathematics emphasis on the interrelations with quantum optics signal theory and magnetic optics feeds a feeling for genuine issues in higher mathematics and theoretical physics
