

C. Return to the following pedigree for questions 12 – 16.

12. The pedigree above shows a family's pedigree for colorblindness. Which row contains the numbers of colorblindness and not have it? From the pedigree above, it can be seen that only the females are carriers for colorblindness
13. Based on your answer to question 12, what kind of trait is colorblindness? Sex linked, recessive. Sex Y linked recessive disorder. Two recessive alleles are needed to cause disease in females and one recessive allele is enough to cause disease in males. This is because males have XY and females have XX. If there is female has one dominant and one recessive allele then she will be a carrier for the disease or disorder.
14. Why does individual IV-7 have colorblindness? The father of IV-7 is colorblind and her mother is a carrier. Therefore she received one allele from both parents.
15. Why do all the daughters in generation II carry the colorblind gene? They all carry the colorblind gene because their father is colorblind, thus they all received the recessive allele from him.
16. Identify or name the colorblind males in generations IV. The colorblind males in generations IV are IV-1 and IV-5.

Analyzing Pedigrees Practice:

Handbook on Analyzing Human Genetic Data Shili Lin, Hongyu Zhao, 2009-10-13 The discipline of statistical genetics is highly computational. Both exact computational methods and simulation-based or hybrid of the two computational packages are indispensable tools and constant companions of researchers in the field. This handbook is intended to provide human geneticists and other biomedical researchers with guidance on selections of appropriate computational methods and software packages for their specific genetic problems. It may also be used by students and other learners as a reference in conjunction with a more theoretical and/or methodologically oriented textbook. This book tries to strike a balance between methodological expositions and practical guidelines for software selections. Wherever possible, comparisons among the competing methods and software are made to highlight the relative advantages and disadvantages of the approaches so that the reader can make informed choices to best match their specific needs. Human genetics has been undergoing an evolution in the past several years as new knowledge and technologies are transforming the field, leading to numerous new discoveries of genes associated with complex traits such as cancer, obesity, and diabetes. Many recent genome-wide association studies employ the case-control design where the study subjects consist of unrelated affected individuals and normal controls. For each individual, a large number of genetic markers are queried.

Theoretical Aspects of Pedigree Analysis Emil Ginsburg, Ida Malkin, Robert C. Elston, 2006 **Models and Methods for the Genetic Analysis of Pedigree Data** J. Pedigree Analysis in Human Genetics Elizabeth Alison Thompson, 1986 *Novel Approaches to the Analysis of Family Data in Genetic Epidemiology* Xiangqing Sun, Jill S. Barnholtz-Sloan, Nathan Morris, Robert C. Elston, 2016-08-17 Genome wide association studies GWAS for complex disorders with large case control populations have been performed on hundreds of traits in more than 1200 published studies <http://www.genome.gov/gwastudies> but the variants detected by GWAS account for little of the heritability of these traits leading to an increasing interest in using family based designs While GWAS studies are designed to find common variants with low to moderate attributable risks family based studies are expected to find rare variants with high attributable risk Because family based designs can better control both genetic and environmental background this study design is robust to heterogeneity and population stratification Moreover in family based analysis the background genetic variation can be modeled to control the residual variance which could increase the power to identify disease associated rare variants Analysis of families can also help us gain knowledge about disease transmission and inheritance patterns Although a family based design has the advantage of being robust to false positives novel and powerful methods to analyze families in genetic epidemiology continue to be needed especially for the interaction between genetic and environmental factors associated with disease Moreover with the rapid development of sequencing technology advances in approaches to the design and analysis of sequencing data in families are also greatly needed The 11 articles in this book all introduce new methodology and using family data substantial new findings are presented in the areas of infectious diseases diabetes eye traits autism spectrum disorder and prostate cancer **Analysis of Human Genetic Linkage** Jurg Ott, 1999-04-16 Introduction and basic genetic principles Genetic loci genetic polymorphisms Aspects of statistical inference Basics of linkage analysis The informativeness of family data Multipoint linkage analysis Penetrance Quantitative phenotypes Numerical and computerized methods Variability of the recombination fraction Inconsistencies Linkage analysis with mendelian disease loci Nonparametric methods Two locus inheritance Complex traits The Practical Guide to the Genetic Family History Robin L. Bennett, 2004-03-24 The Practical Guide to The Genetic Family History Robin L Bennett Compiling the most recent genetic developments in medical specialties The Practical Guide to the Genetic Family History is a valuable resource which outlines the proper methods for taking and recording a patient's family medical history allowing primary care physicians to be more efficient in diagnosing conditions with potential genetic components With genetic screening forms an overview of directed questions pedigree nomenclature and outlining common approaches used genetic counselor Robin L
