Instructors Guide Connie Will-Black, Judith Eighmy, 2001-09 Reproduction in Mammals Virginia Hayssen, Teri J. Orr, 2017-10-27 Newborn mammals can weigh as little as a dime or as much as a motorcycle Some receive milk for only a few days whereas others nurse for years Humans typically have only one baby at a time following nine months of pregnancy but other mammals have 20 or more young after only a few weeks in utero What causes this incredible reproductive diversity Reproduction in Mammals is a fascinating examination of the diverse reproductive strategies of a broad spectrum of mammals and the ways in which natural selection has influenced that diversity While accounts of reproduction in individual taxa abound this unique book's comprehensive coverage gathers stories from many taxa into a single cohesive perspective that centers on the reproductive lives of females The authors shed light on intriguing questions such as Do bigger moms have bigger babies Do primates have longer pregnancies than other groups Do aquatic animals have particular patterns Do carnivores like lions often produce larger litters than prey species The book opens with the authors definition of what constitutes a female perspective and an examination of the evolution of reproduction in mammals It then outlines the individual female her genetics anatomy and physiology From this nuanced basis the text progresses to mirror the female reproductive cycle and includes her interactions with males and offspring The final section contextualizes the reproductive cycle within the rest of the world both abiotic and biotic environments To close the authors include dedicated chapters on human concerns conservation and women as mammals Readers will come away from this thought provoking book with an

emerging reproductive sciences Understanding reproductive biology is centrally important to the way many of the world's conservation problems should be tackled Currently the extinction problem is huge with up to 30% of the world's fauna being expected to disappear in the next 50 years Nevertheless it has been estimated that the global population of animals in zoos encompasses 12 000 15 000 species and we anticipate that every effort will be made to preserve these species for as long as possible minimizing inbreeding effects and providing the best welfare standards available Even if the reproductive biology community cannot solve the global biodiversity crisis for all wild species we should do our best to maintain important captive populations Reproductive biology in this context is much more than the development of techniques for helping with too little or too much breeding While some of the relevant techniques are useful for individual species that society might target for a variety of reasons whether nationalistic cultural or practical technical developments have to be backed up by thorough biological understanding of the background behind the problems
