Semigroups of Operators - Theory and Applications Jacek Banasiak, Adam Bobrowski, Mirosław Lachowicz, Yuri Tomilov, 2020-06-12 This book features selected and peer reviewed lectures presented at the 3rd Semigroups of Operators Theory and Applications Conference held in Kazimierz Dolny Poland in October 2018 to mark the 85th birthday of Jan Kisiński Held every five years the conference offers a forum for mathematicians using semigroup theory to discover what is happening outside their particular field of research and helps establish new links between various sub disciplines of semigroup theory stochastic processes differential equations and the applied fields The book is intended for researchers postgraduate and senior students working in operator theory partial differential equations probability and stochastic processes analytical methods in biology and other natural sciences optimisation and optimal control The theory of semigroups of operators is a well developed branch of functional analysis Its foundations were laid at the beginning of the 20th century while Hille and Yosida's fundamental generation theorem dates back to the forties The theory was originally designed as a universal language for partial differential equations and stochastic processes but at the same time it started to become an independent branch of operator theory Today it still has the same distinctive character it develops rapidly by posing new internal questions and in answering them discovering new methods that can be used in applications On the other hand it is being influenced by questions from PDEs and stochastic processes as well as from applied sciences such as mathematical biology and optimal control and as a result it continually gathers new momentum However many results both from semigroup theory itself and the applied sciences are phrased in discipline specific languages and are hardly known to the broader community

Energy Transfers in Atmosphere and Ocean Carsten Eden,Armin Iske,2019-01-23 This book describes a recent effort combining interdisciplinary expertise within the Collaborative Research Centre Energy transfers in atmosphere and ocean

TRR 181 which was funded by the German Research Foundation DFG Energy transfers between the three dynamical regimes small scale turbulence internal gravity waves and geostrophically balanced motion are fundamental to the energy cycle of both the atmosphere and the ocean Nonetheless they remain poorly understood and quantified and have yet to be adequately represented in today s climate models Since interactions between the dynamical regimes ultimately link the smallest scales to the largest ones through a range of complex processes understanding these interactions is essential to constructing atmosphere and ocean models and to predicting the future climate To this end TRR 181 combines expertise in applied mathematics meteorology and physical oceanography This book provides an overview of representative specific topics addressed by TRR 181 ranging from a review of a coherent hierarchy of models using consistent scaling and approximations and revealing the underlying Hamiltonian structure a systematic derivation and implementation of stochastic and backscatter parameterisations an exploration of the dissipation of large scale mean or eddying balanced flow and ocean eddy parameterisations and a study on gravity wave breaking and mixing the interaction of waves with the mean flow and stratification wave wave interactions and gravity wave parameterisations to topics of a more numerical nature such as the spurious mixing and dissipation of advection schemes and direct numerical simulations of surface waves at the air sea interface In TRR 181 the process oriented topics presented here are complemented by an operationally oriented synthesis focusing on two climate models currently being developed in Germany In this way the goal of TRR 181 is to help reduce the biases in and increase the accuracy of atmosphere and ocean models and ultimately to improve climate models and climate predictions

Discrete and Continuous Models in the Theory of Networks Fatihcan M. Atay,Pavel B. Kurasov,Delio Mugnolo,2020-09-03 This book contains contributions from the participants of the research group hosted by the ZiF Center for Interdisciplinary Research at the University of Bielefeld during the period 2013 2017 as well as from the conclusive conference organized at Bielefeld in December 2017 The contributions consist of original research papers they mirror the scientific developments fostered by this research program or the state of the art results presented during the conclusive conference The volume covers current research in the areas of operator theory and dynamical systems on networks and their applications indicating possible future directions The book will be interesting to researchers focusing on the mathematical theory of networks it is unique as for the first time continuous network models a subject that has been blooming in the last twenty years are studied alongside more classical and discrete ones Thus instead of two different worlds often growing independently without much intercommunication a new path is set breaking with the tradition The fruitful and beneficial exchange of ideas and results of both communities is reflected in this book

Transmutation Operators and Applications Vladislav V. Kravchenko,Sergei M. Sitnik,2020-04-11 Transmutation operators in differential equations and spectral theory can be used to reveal the relations between different problems and often make it possible to transform difficult problems into easier ones Accordingly they represent an important mathematical tool in the theory of inverse and scattering problems of

ordinary and partial differential equations integral transforms and equations special functions harmonic analysis potential theory and generalized analytic functions This volume explores recent advances in the construction and applications of transmutation operators while also sharing some interesting historical notes on the subject
