

Unit 6: Thermochemistry**6.1: Heat Transfer and Thermal Equilibrium****6.2: Heat Capacity and Calorimetry****6.3: Entropy and Spontaneous Changes**

2. Use the Boltzmann-probability distribution curves below to predict temperatures of the mixtures of particles.

Temperature: is a measure of the average kinetic energy of the particles in a system. The kinetic energy for particles moving with v is $\frac{1}{2}mv^2$, so the more of particles that move fast enough, the more kinetic energy we will see for a system. Therefore, the more particles move faster, the more kinetic energy we will see for the system. It's important to note that the more particles move faster, the more kinetic energy we have.

3. Sketch a curve to represent the relative distribution of the particles in the following two gas samples of the same gas.

- a. In System 1, it is a higher or lower temperature than System 2? Justify your answer.
System 1 is at a higher temperature than System 2. Temperature is a measure of the average KE of the particles in the system. In System 1, the particles are moving faster, so the average KE is higher. In System 2, the particles are moving slower, so the average KE is lower. Therefore, System 1 is at a higher temperature than System 2.
- b. In which direction will thermal energy be transferred? Justify your answer in terms of molecular collisions.
Thermal energy will be transferred from System 1 to System 2. In System 1, the particles are moving faster, so they will collide with the particles in System 2, which are moving slower. These collisions will transfer energy from System 1 to System 2, until the temperatures are equal.
