

DIGESTIVE SYSTEM

Review Worksheet

Teeth break and grind food into small pieces and enzymes in the saliva kill pathogens and begin to break down carbohydrates. Saliva also moistens the food which makes it easier to chew.

What is Salvia?

Saliva contains amylase. Amylase begins the chemical digestion by breaking chemical bonds in starches to release sugars. Lysozyme (another enzyme) fights infection. It digests the cell walls of many bacteria.

The bolus (broken down food) moves from the mouth through the esophagus into the stomach. The bolus is moved by muscle contractions that push food down the esophagus called peristalsis.

Chemical and physical digestion occurs in the stomach. Pepsin is released and breaks down proteins into smaller pieces. Mucus is released to protect the stomach lining. Muscle contractions cause the bolus to churn in the stomach which breaks up food and turns it into chyme. Protein digestion also occurs.

They help the pancreatic enzymes with fat digestion. The liver produces bile which is stored in the gallbladder until it is needed. The bile helps break down fats which makes it easier for enzymes to digest the fat.

The large intestine absorbs water from the chyme. Bacteria in the large intestine feed on the undigested materials and they help produce compounds that the body needs such as vitamin K. The undigested materials move through it and is then eliminated from the body.

Chyme is slowly released into the small intestine through the pyloric valve. The chyme mixes with the enzymes and digestive fluids from the pancreas and liver in the duodenum. The duodenum is the main area where digestion takes place in the small intestine. Nutrients are absorbed by the wall of the small intestine which are covered in villi. The villi are covered in tiny microvilli that absorb nutrients.
