Old Questions and Young Approaches to Animal Evolution José M. Martín-Durán, Bruno C. Vellutini, 2019-07-22 Animal evolution has always been at the core of Biology but even today many fundamental questions remain open The field of animal evo devo is leveraging recent technical and conceptual advances in development paleontology genomics and transcriptomics to propose radically different answers to traditional evolutionary controversies This book is divided into four parts each of which approaches animal evolution from a different perspective The first part chapters 2 and 3 investigates how new sources of evidence have changed conventional views of animal origins while the second chapters 4 8 addresses the connection between embryogenesis and evolution and the genesis of cellular tissue and morphological diversity The third part chapters 9 and 10 investigates how big data in molecular biology is transforming our understanding of the mechanisms governing morphological change in animals In closing the fourth part chapters 11 13 explores new theoretical and conceptual approaches to animal evolution Old questions and young approaches to animal evolution offers a comprehensive and updated view of animal evolutionary biology that will serve both as a first step into this fascinating field for students and university educators and as a review of complementary approaches for researchers

Animal cell type diversity, evolution and regulation Sebé-Pedrós, Arnau, 2023-01-26 A fundamental question in biology is how the myriad of specialized cell behaviors observed in a multicellular organism is encoded by a single genome sequence and which gene regulatory mechanisms orchestrate the spatiotemporal deployment and maintenance of these cell type specific programs Decades of genetic and more recently genomic analyses have identified multiple layers of regulation including specific molecular players and their interactions This regulation ultimately results in cell specific gene expression profiles that define coordinated cell cooperation at the tissue and whole organism levels However the diversity and evolutionary dynamics of cell types remain almost completely unexplored beyond selected tissues in a few species and so it is the gene regulatory networks that define them Similarly little is known about the emergence of complex genome regulatory mechanisms that support cell type specific programs and cellular memory including genome spatial compartmentalization and chromatin dynamics The advent of low input highly multiplexed epigenomic and transcriptomic profiling methods even at single cell resolution and the broad applicability of these techniques to diverse

systems bypasses the need to obtain large amounts of biological material by culturing or dissecting particular tissues or cell types. This paves the way for the comparative multi level analysis of cell differentiation in species and ontogenetic stages that span an unprecedented phylogenetic breadth and represent diverse levels of biological complexity ranging from unicellular temporal differentiation dynamics and simple multicellular behaviors as in some protistan eukaryotes through loosely integrated and limitedly diversified ensembles of cell types as in early branching animals to organisms with elaborate tissue and body plan organization as in bilaterian animals. The comparative approach through the prism of evolutionary theory and supported by a robust phylogenetic framework holds the promise of offering far reaching insights into the fundamental principles that govern cell biological systems and the associated molecular mechanisms of genome regulation.

Key Transitions in Animal Evolution Rob Desalle, Bernd Schierwater, 2010-12-07 Tackling one of the most difficult and delicate of the evolutionary questions this challenging book summarizes the more recent results in phylogenetics and developmental biology that address the evolution of key innovations in metazoans. Divided into three sections the first considers the phylogenetic issues involving this area of the tree of life.

Compassion and Healing in Medicine

and Society Gregory Fricchione, 2011-12 Reconciling the scientific principles of medicine with the love essential for meaningful care is not an easy task but it is one that Gregory L. Fricchione performs masterfully in *Compassion and Healing in Medicine and Society*. At the core of this book is a thought provoking analysis of the relationship between evolutionary science and neuroscience. Fricchione theorizes that the cries for attachment made by seriously ill patients reflect an underlying evolutionary tenet called the separation challenge attachment solution process. The pleadings of patients he explains are verbal expressions of the history of evolution itself. By exploring the roots of a patient's attachment needs we come face to face with a critical component of natural selection and the evolutionary process. Medicine engages with the separation challenge attachment solution process on many levels of scientific knowledge and human meaning and healing. Fricchione applies these concepts to medical care and encourages physicians to fully understand them so they can better treat their patients. Compassionate humanistic care promotes physical, emotional and spiritual healing precisely because it is consonant with how life, the brain and humanity have evolved. It is therefore not a luxury of modern medical care but an essential part of it. Fricchione advocates an attachment based medical system one in which physicians evaluate stress and resiliency and prescribe an integrative treatment plan for the whole person designed to accentuate the propensity to health. There is a wisdom or perennial philosophy based on compassionate love that Fricchione stresses the medical community must take advantage of in designing future health care and society must appreciate as it faces its separation challenges.
