A4 Gear Box:

Spiral Bevel Pinion Crack Detection in a Helicopter Gearbox, 2003 The vibration resulting from a cracked spiral bevel pinion was recorded and analyzed using existing Health and Usage Monitoring System HUMS techniques A tooth on the input pinion to a Bell OH 58 main rotor gearbox was notched and run for an extended period at severe over torque condition to facilitate a tooth fracture Thirteen vibration based diagnostic metrics were calculated throughout the run After 101 41 hours of run time some of the metrics indicated damage At that point a visual inspection did not reveal any damage The pinion was then run for another 12 minutes until a proximity probe indicated that a tooth had fractured This paper discusses the damage detection effectiveness of the different metrics and a comparison of effects of the different accelerometer locations **Department of the Army Technical Manual**, 1951 **Technical Manual** United States.
