OWNER'S MANUAL

VEHICLES SOLD IN CANADA

With respect to any Vehicles Sold in Canada, the name Chrysler Group LLC shall be deemed to be deleted and the name Chrysler Canada Inc. used in substitution therefore.

DRIVING AND ALCOHOL

Drunken driving is one of the most frequent causes of accidents.

Your driving ability can be seriously impaired with blood alcohol levels far below the legal minimum. If you are drinking, don't drive. Ride with a designated non-drinking driver, call a cab, a friend, or use public transportation.

WARNING!

Driving after drinking can lead to an accident. Your perceptions are less sharp, your reflexes are slower, and your judgment is impaired when you have been drinking. Never drink and then drive.

This manual illustrates and describes the operation of features and equipment that are either standard or optional on this vehicle. This manual may also include a description of features and equipment that are no longer available or were not ordered on this vehicle. Please disregard any features and equipment described in this manual that are not on this vehicle.

Chrysler Group LLC reserves the right to make changes in design and specifications, and/or make additions to or improvements to its products without imposing any obligation upon itself to install them on products previously manufactured.

Kenyon,David W. Marshak,Botir Sagdullaev,2019-10-16 Photons are sensed by retinal photoreceptors whose matrix like distribution underlies the transformation of illumination patterns of the visual scene into photoreceptor activity patterns in a visuotopic fashion Activity of neighboring photoreceptors then are compared by secondary bipolar cells to decipher

information regarding luminosity and color contrast Bipolar cells achieve this by comparing signals received directly from their center receptive field with those come from spatially offset surrounding receptive field areas mediated by inhibitory sign inverting horizontal cells This information is ultimately sent to retinal ganglion cells the output neurons of the retina In addition to the excitatory bipolar cell inputs spatial and temporal features of ganglion cell activation are robustly modified by inner retinal amacrine cells through inhibitory chemical and or excitatory electrical synaptic inputs Ganglion cells sample various bipolar cell subtypes in their dendritic field and utilize collected inputs to generate a spike output code on luminosity contrast color contrast object motion background motion motion direction changes in background illumination in a subtype specific manner Ganglion cells in each subtype cover the retinal surface economically thus collective information across the population provide a feature pattern and through time a feature movie to the brain Some of these movies are utilized for image perception whereas others are sent to accessory visual brain centers to control eye movement pupil contraction or circadian entrainment A large body of information has been revealed in the past decade regarding this field however much of the details still remain unknown or even enigmatic including i the precise description of neural circuits that serve each ganglion cell subtype to generate a specific feature movie ii the estimation of the number of various ganglion cell subtypes that partake in image forming and non image forming signaling towards the brain iii the description of changes in the inputs morphology and signaling of retinal ganglion cells when the tissue is under stress or undergoes disease related degenerative processes iv the comparison of ganglion cell classes with those of the human retina and finally v the practical use of all the above information to establish retina inspired visual algorithms to suit computer drone and or robotic vision Therefore research articles in this issue were collected to touch upon each of these topics and highlight recent advances of the related field
