

Energy Flow in an Ecosystem

(adapted from Biozone Environmental Science Modular Workbook)

The Laws of Thermodynamics state:

- 1) Energy cannot be created or destroyed but can be converted to another form, and
- 2) As energy conversions occur, some usable energy is "lost" as heat

Therefore, energy stored in the biomass at each trophic level in an ecosystem can be transferred to another trophic level, with some being "lost" as heat energy to the environment. The percentage of energy transferred from one trophic level to the next varies between 5-20% and is called the *ecological efficiency*. The 10% rule of energy transfer is often used. In order to understand energy flow, one must also understand the idea of ecosystem *productivity*.

- Gross Primary Productivity (GPP) – total organic material produced by plants, including that lost as heat due to respiration
- Net Primary Productivity (NPP) – the amount of biomass that is available to consumers at subsequent trophic levels after accounting for that lost as heat
