**Principles of Veterinary Animal Physiology** Tanmoy Rana, 2025-10-22 This textbook for advanced graduate and postgraduate veterinary students introduces animal behaviour, offering insights into its origins, cognitive aspects, communication, environmental influences, biological mechanisms, complex behaviours, adaptive strategies, and practical applications. The initial chapters present fundamental principles underpinning animal behaviour, elucidating the roles of evolution, genetics, and ecology. Subsequent chapters introduce the role of natural selection, habitat selection, and pheromones, alongside exploring conflicts, predator-prey dynamics, and the impact of domestication on behaviour. The book further delves into topics such as habitat selection, foraging strategies, predator-prey dynamics, and the effects of domestication on behaviour. It unravels the mysteries of animal defences, altruism, social dominance, territoriality, and the finely tuned art of food and habitat selection. Additionally, it covers the biological mechanisms governing behaviour, unearthing the roles played by neuroendocrinology, biological clocks, and genetics. Towards the end, the textbook examines the practical relevance of behavioural insights in veterinary science.

Machine Learning for Ecology and Sustainable Natural Resource Management  
Grant Humphries, Dawn R. Magness, Falk Huettmann, 2018-11-05 Ecologists and natural resource managers are charged with making complex management decisions in the face of a rapidly changing environment resulting from climate change energy development urban sprawl invasive species and globalization Advances in Geographic Information System GIS technology digitization online data availability historic legacy datasets remote sensors and the ability to collect data on animal movements via satellite and GPS have given rise to large highly complex datasets These datasets could be utilized for making critical management decisions but are often messy and difficult to interpret Basic artificial intelligence algorithms i e machine learning are powerful tools that are shaping the world and must be taken advantage of in the life sciences In ecology machine learning algorithms are critical to helping resource managers synthesize information to better understand complex ecological systems Machine Learning has a wide variety of powerful applications with three general uses that are of particular interest to ecologists 1 data exploration to gain system knowledge and generate new hypotheses 2 predicting ecological patterns in space and time and 3 pattern recognition for ecological sampling Machine learning can be used to make predictive assessments even when relationships between variables are poorly understood When traditional techniques fail to capture the relationship between variables effective use of machine learning can unearth and capture previously unattainable insights into an ecosystem s complexity Currently many ecologists do not utilize machine learning as a part of the scientific process This volume highlights how machine learning techniques can complement the traditional methodologies currently applied in this field
